

Environmental Justice

Draft Analysis of Low-Income and Minority Communities –July 2003

I. Introduction

President Clinton issued Executive Order 12898 on Environmental Justice because government programs and projects have historically had disproportionate negative impacts on low-income and minority populations. The order directs agencies to identify and address "disproportionately high and adverse human health or environmental effects of its program, policies, and activities on minority populations and low-income populations." Therefore, a key issue for the implementation of transportation projects is whether they have a disproportionate negative impact on low income and/or minority communities.

We know from previous examinations of the I-5 Corridor that there are low income and minority communities adjacent to potential transportation projects identified in the Portland/Vancouver I-5 Corridor Strategic Plan. As projects in the Strategic Plan move into an implementation phase, it is important to identify the low income and minority communities. Identification of the communities helps us to conduct targeted outreach to involve the community in the development and analysis of the projects. It will also help us to assess whether the communities are disproportionately impacted, and to design mitigation and enhancement projects to off-set any disproportionate impact.

This paper has three objectives:

- describe data sources
- explain how the data were analyzed
- present maps showing minority and low income neighborhoods

II. Methodology and Data

Procedures from *Draft National Guidance for Conducting Environmental Justice Analyses*, published by the Office of Environmental Justice, US Environmental Protection Agency (EPA), October 1, 1998 are the primary source of guidance for this Environmental Justice (EJ) analysis. In addition, this analysis incorporates suggestions from EPA and other agency staff, as well as members of the community.

The *EPA Guidance* suggests methodologies and data sources to identify potential EJ areas of concern. The *Guidance* suggests comparing Census block group data to a reference area. This analysis compares block group data to the Portland/Vancouver Primary Metropolitan Statistical Area (PMSA). The EPA suggests using the state as the reference area. However, using the state as a reference area for this analysis would result in making comparisons to different standards—one for Vancouver residents, and another for Portland residents. This analysis compares block group data to the Portland/Vancouver PMSA data because the Portland/Vancouver metropolitan area operates as one economic and social region. Clark County in Washington, and Clackamas, Columbia, Multnomah, Washington and Yamhill Counties in Oregon comprise the Portland/Vancouver PMSA.

The following sections describe the analysis procedures used to identify minority and low income communities in the I-5 Corridor.

III. Minority Data Analysis

A. Race, Ethnicity and Defining “Minority”

The *EPA Guidance* provides a recommendation for defining and calculating the minority population based on racial and Hispanic or Latino ethnicity Census data. This method avoids double counting, while providing an inclusive definition of minority. Census data on race and Hispanic or Latino ethnicity are derived from two questions on census forms: “Is this person Spanish / Hispanic / Latino?” and “What is this person’s race?” People who are both Hispanic / Latino and a racial minority would be double counted if the totals for each question are used to calculate minorities. To avoid that double counting, the EPA Guidance recommends using a table that shows Hispanic or Latino by Race. (2000 Census Summary File 3 (SF3) Table P7 Hispanic or Latino by Race)

The recommended method sums the total number of Not Hispanic or Latino of all races except White alone and all Hispanic or Latinos. This is equivalent to an alternative calculation of the total population minus Not Hispanic or Latino White alone. Table 1 below shows how we calculated the total number of minorities for the Portland/Vancouver PMSA. The shaded numbers show what is included in the first method of calculation. The alternative method, subtracting Not Hispanic or Latino White alone from the total population is below that.

Table 1. Calculation of Minority Population for Portland/Vancouver PMSA

	Not Hispanic or Latino:	Hispanic or Latino:	Minority
White alone	1,563,973	54,093	54,093
Black or African American alone	47,020	1,429	48,449
American Indian and Alaska Native alone	14,390	2,031	16,421
Asian alone	86,184	849	87,033
Native Hawaiian and Other Pacific Islander alone	5,660	304	5,964
Some other race alone	2,538	70,655	73,193
Two or more races	56,208	12,675	68,883
Total Minority Population			354,036
Portland/Vancouver PMSA Total:	1,918,009		
Minus White Not Hispanics or Latino	1,563,973		
Minority Population =	354,036		

Data: U.S. Census Bureau, Census 2000 SF3, Table P7 Hispanic or Latino by Race

B. Identifying Potential Areas of Concern for Minorities

The *EPA Guidance* suggests identifying a potential EJ area of concern by comparing the percent minority in a Census block group to a threshold percent equal to the reference area percent plus 20 %. As previously stated, this analysis uses the Portland/Vancouver PMSA as the reference area to calculate the threshold percent. Using this methodology, the PMSA is 18.46 % minority. The PMSA percent plus 20 % is 22.15 %. Block groups with minority populations equal to or greater than 22.15% are EJ potential areas of concern. Table 2 below shows the calculation for the threshold percent for minorities for the PMSA.

Table 2. Calculation for Minority Threshold Percent

PMSA total population	1,918,009
Not Hispanic or Latino, White alone	-1,563,973
Number minorities	354,036
Percent minorities	$354,036 / 1,918,009 = 18.46\%$
Percent minorities plus 20%	$18.46\% + (18.46\% \times .20) = 22.15\%$ or $18.46\% \times 120\% = 22.15\%$

Figures 1 and 2 show Census block groups that are potential areas of concern, with minority populations equal to or greater than the Portland/ Vancouver PMSA percent plus 20% (22.15%). Figure

1 is a map of the I-5 corridor in North Portland and Clark County. Figure 2 is a smaller scale map with the same data for the Portland/Vancouver PMSA.

C. Non-English Speakers

Using the above methodology for identifying minority communities does not include white immigrant populations. At the request of community members, we analyzed Census data on the ability to speak English to identify communities with immigrant populations. Census data is available on ability to speak English for respondents who reported that they spoke a language other than English at home. Census questionnaires ask respondents who speak a language other than English at home to indicate their ability to speak English in one of the following categories: "Very well," "Well," "Not well," or "Not at all." Figure 3 shows block groups where the percent of population over 5 years old for whom the response was "Not well" or "Not at all" was above the PMSA average of 3.83%. The map also shows areas with higher concentrations of those who speak English "Not well" or "Not at all" by dividing the block groups above the PMSA percent into three percentage ranges. We use the information on which languages are spoken at home to target outreach for public involvement, translate meeting announcements, and provide interpreters at public meetings.

IV. Income Data Analysis

A. Defining Low-Income

The *EPA Guidance* discusses a number of ways to identify low-income communities, but in general recommends using the poverty threshold data developed by the Census Bureau. The Census Bureau prepares statistics on the number of people below the poverty threshold. The Bureau adjusts the thresholds according to family size and number of dependents. Every individual in a family with income below the threshold is considered poor. Income for this calculation counts money income before taxes and does not include capital gains and non-cash benefits (such as public housing, Medicaid, and food stamps). Census poverty data does not include people in institutional group quarters, military barracks, or for unrelated individuals under age 15 (such as foster children). An advantage to using poverty threshold data is that they adhere to a Federal statistical standard. The Federal Office of Management and Budget prescribes this definition as the official poverty measure for federal agencies to use in their statistical work. Table 6 in the appendix shows the 1999 poverty thresholds, by household size and number of children, that the Census Bureau used to determine poverty status for the 2000 Census.

The Census Bureau reports the number of individuals in families that have incomes within ranges that are ratios of the Federal poverty threshold. We used this data to determine benchmarks to identify very low-income and low-income populations. The *EPA Guidance* defines very low income as below the

poverty line, and low-income as below two times the poverty line. Table 3 shows the poverty data for the Portland / Vancouver PMSA with the number for low-income in bold and very low-income shaded.

Table 3. Ratio of Income to 1999 Poverty Level

Portland--Vancouver, OR--WA PMSA		Totals
Under .50	78,941	
50 to .74	45,578	
75 to .99	54,009	178,528 (very low-income)
1.00 to 1.24	62,954	
1.25 to 1.49	69,224	
1.50 to 1.74	69,823	
1.75 to 1.84	32,935	457,459 (low- income)
1.85 to 1.99	43,995	
2.00 and over	1,429,164	
Total (for whom poverty status is calculated)	1,886,623	

Data: U.S. Census Bureau, Census 2000, SF3 Table P88. Ratio of Income in 1999 to Poverty Level.

B. Identifying Potential EJ Areas of Concern for Low-Income

The EPA *Guidance* suggests identifying potential EJ areas of concern by comparing the percent of population defined as low-income in block groups to a reference area percent. Again, this analysis uses the Portland/Vancouver PMSA as the reference area. Using this methodology, the PMSA very low - income percent is 9.46%; the low-income percent is 24.25%. The table below shows calculations for the reference area percents.

Table 4. Calculation of Very Low-Income and Low Income Reference Area Percent

	Number	Calculation of Reference Area Percent
Total (for whom poverty status is calculated)	1,886,623	
Very low-Income	178,528	178,528 / 1886623 = 9.46%
Low-income	457,459	457,459 / 1886623 = 24.25%

Figures 4 and 5 show block groups with percents of very low-income and low-income that are above the PMSA percents. Figure 4 shows the I-5 Corridor in North Portland and Clark County. Figure 2 is a smaller scale map with the same data for the Portland/Vancouver PMSA.

V. Conclusions

Based on the analysis conducted, the I-5 Corridor does have areas of concern for low income and/or minority communities. These communities are located both in Portland and in Vancouver. They are adjacent to potential highway and light rail projects that are recommended by the I-5 Corridor Strategic Plan. To complete an Environmental Justice analysis, the geographical area that will be impacted needs to be identified and the impacts within the areas of concern need to be identified.

Attachments

Table 1 below shows the percent minority population for alternative reference areas that are alternative candidates for comparison to block groups for purposes of identifying minority communities.

Table 1. Comparison of Selected Thresholds for Identification of Minority Communities (with number of block groups meeting threshold criteria)
