

Road Map Item #:	5.11
Product Name:	RISK AND CONTINGENCY MANAGEMENT PLAN (RCMP)
PMP Appendix:	APPENDIX C
Submittal Date:	May 1, 2013

ABSTRACT: This deliverable describes how the team will deal with uncertainty and risks that affect project objectives, most notably cost and schedule. Project risk management is an ongoing part of project management and is done throughout the life of the project. The CRC project management team has cultivated and continues to nurture a risk aware culture. This plan is calibrated to the Project Management Plan required for the Full Funding Grant Agreement (FFGA) stage of project development. The project team continuously monitors risks and uses this plan continuously throughout the completion of design, contracting and construction, and successful commencement of revenue service.

RISK AND CONTINGENCY MANAGEMENT PLAN

Draft Report

Title VI

The Columbia River Crossing project team ensures full compliance with Title VI of the Civil Rights Act of 1964 by prohibiting discrimination against any person on the basis of race, color, national origin or sex in the provision of benefits and services resulting from its federally assisted programs and activities. For questions regarding WSDOT's Title VI Program, you may contact the Department's Title VI Coordinator at (360) 705-7098. For questions regarding ODOT's Title VI Program, you may contact the Department, you may contact the Department's Civil Rights Office at (503) 986-4350.

Americans with Disabilities Act (ADA) Information

If you would like copies of this document in an alternative format, please call the Columbia River Crossing (CRC) project office at (360) 737-2726 or (503) 256-2726. Persons who are deaf or hard of hearing may contact the CRC project through the Telecommunications Relay Service by dialing 7-1-1.

vi Risk and Contingency Management Plan Draft Report

This page left blank intentionally.

1. Overview

¹This document is the Project Risk and Contingency Management Plan (RCMP) for the Columbia River Crossing (CRC) program. This plan describes how the team will deal with uncertainty and risks that affect project objectives, most notably cost and schedule. Project risk management is an ongoing part of project management and is done throughout the life of the project. The CRC project management team has cultivated and continues to nurture a risk aware culture. This plan is calibrated to the Project Management Plan required for the Full Funding Grant Agreement (FFGA) stage of project development. The project team continuously monitors risks and uses this plan continuously through the completion of design, contracting and construction.

The Risk and Contingency Management Plan is a sub-plan of the Project Management Plan (PMP) for CRC. The purpose of the RCMP is to highlight specific areas of management focus as identified through the Cost Estimation Validation Process (CEVP), and Federal Transit Authority (FTA) risk review process.

This RCMP is a living document that is updated as necessary during project development and delivery.

1.1 Topics in this RCMP

- 1. Overview. This chapter provides a summary of the RCMP and how it fits into the overall project management plan for the Columbia River Crossing, CRC project.
- 2. Goals and Objectives. This chapter describes the major goals and objectives for risk and contingency management for CRC.
- 3. Risk Review Process. This chapter describes the procedures used for development of the Risk and Contingency Management Plan (RCMP) risk identification, risk assessment, risk response, risk protection measures (such as Secondary Mitigation and minimum contingencies) and risk management and control.
- 4. Insurance. This chapter summarizes use of insurance at CRC and where to find the detailed information.
- 5. Primary Mitigation. This chapter describes primary risk response actions to mitigate the impact of identified key risks.
- 6. Contingency Management. This chapter describes cost and schedule contingency protections including contingency recommendations and management of cost

¹ This Project Risk and Contingency Management Plan follows the rigorous standards and policies set forth by WSDOT as expressed in their directional documents, and their Project Risk Management Guide, and their Workshop Guidelines posted at: <u>http://www.wsdot.wa.gov/Projects/ProjectMgmt/RiskAssessment/</u>. This RCMP is also consistent with the guidance provided by FTA Oversight Procedure 40 – Risk and Contingency Review and follows the RCMP structure provided in Appendix G.

contingency and schedule contingency. This includes procedures for authorization, transfer, and use of contingency.

- 7. Secondary Mitigation. This chapter describes the use of secondary mitigation and a list of items and timing necessary for implementation of secondary mitigation actions.
- 8. Risk Management and Risk Mitigation this chapter describes the plans for administering and maintaining this RCMP, including:
 - Identification and Analysis of project risk;
 - Risk response options (primary and secondary);
 - Risk monitoring and control;
 - Documenting and reporting to the Federal Transit Administration (FTA);
 - Design control processes;
 - Plans for updating the risk register;
 - Plans and timing for updating the RCMP.

1.2 Risk Assessment Activities and Key Project Milestones

The WSDOT Cost Estimation Validation Process (CEVP) and FTA Risk Assessment (RA) are workshops held to help identify and manage risks.

Table 1-1 below lists some key milestones for the CRC project; the schedule management contingency section of this document provides dates.

CEVP workshop	October 9-12, 2006
Risk Assessment Workshop	July 23-27, 2007
CEVP workshop	February 2-6, 2009
Risk Review Update (LPA Options)	August 29-30, 2009
CEVP workshop	November 1-2, 2010
CEVP workshop	May 2-6, 2011
Record Of Decision Signed	December 7, 2011
CEVP workshop risk register review	April 23-27, 2012
Risk Based Estimating Exercise	October 12 – November 16, 2012
Full Funding Grant Agreement Award (FFGA)	
Ad Date for first contract package	

Table 1-1. CRC Risk Management Activities and Associated Project Activities

Key risks identified for CRC quantify both cost and schedule. These risks are identified, defined, quantified, and analyzed to effectively use resources in response to risks. This document provides the plan for sound risk management and will be augmented with supplemental information as the project develops.

1.3 Updates to the RCMP

This RCMP will be regularly reviewed by the Federal Transit Administration (FTA) Project Management Oversight Contractor (PMOC), the Federal Highway Administration and WSDOT (as the grantee). Updates will be made as necessary.

This Plan incorporates recommendations from FTA PMOC Document reviews and formal and informal review comments by the project team.

Ongoing project risk management for CRC will be provided in monthly Risk Management meetings incorporating recent risk assessment information.

Risk management is an ongoing process through design, construction and project opening. It is not possible to eliminate all risk, however through our project risk management process and risk workshops, we blend intuition and reason to produce more informed decisions. Including the appropriate subject matter experts and project team at the workshops allows for vital communication, a broader perspective, and fills in the knowledge gaps by identifying and reducing risks. 1-4 Risk and Contingency Management Plan Draft Report

This page left blank intentionally.

2. Goals and Objectives

2.1 Goals

As the CRC program progresses and moves into final design and construction, the goals of this RCMP are to:

- 1. Ensure that CRC risks are managed pro-actively, within the control of the program.
- 2. CRC is committed to complete the project within budget and on schedule.
- 3. Maintain and manage appropriate cost and schedule contingency through project delivery.
- 4. Ensure that risks outside the direct control of the CRC Program are effectively dealt with through collaboration with the CRC partners and internal and external stakeholders to minimize the impacts of these events on delivery of the program within budget and schedule.

2.2 Objectives

The main objective is to respond to identified threat risks and make the most of opportunities. The CRC Program will manage risks for each of its projects and provide updates throughout program delivery. RCMP objectives, include:

- Identify and define key risk events (program level and project level)
- Ensure that risks affect more than one project are correctly identified and managed
- Avoid double-counting of risk events
- Report on the Status of key risks (monitor and control capabilities)
 - Response actions taken
 - Cost of response actions
 - Results of response actions
 - Does risk remain active or can it be retired?
 - Summary of risk management efforts and outcomes

2-2 Risk and Contingency Management Plan Draft Report

The Risk and Contingency Management Plan for the CRC program is consistent with:

Federal Transit Administration (FTA), Oversight Procedure 40 (OP 40)
Federal Highway Administration (FHWA)
Oregon Department of Transportation (ODOT)
Washington State Department Of Transportation (WSDOT)
Project Risk Management, Guidance for WSDOT Projects, July 2010
Guidelines for Cost Risk Assessment-Cost Estimate Validation Process Workshops, March 2010
Instructional Letter IL 4071 Risk-Based Project Estimates for Inflation Rates, Market Conditions, and
Percentile Selection, February 23, 2012

3. Risk Review Process

CRC risk management emphasizes "solution-based" thinking by developing response actions. A key tool is frequent and timely communication on how the project risks are trending and how they may affect neighboring projects.

Communicating risk management strategies will be included in already regular meetings. Table 3-1 offers a standard meeting plan. These meetings can be stand-alone or can be agenda items.

Meeting	Meets	Length	Attendees
Project interface task force	2 weeks	1 hour	CRC risk manager and project managers
Risk update (with each specialty group or project)	Monthly	1 hour	CRC risk manager and project managers (one-on one)
Risk management validation Interface risk management	Quarterly	1 day	CRC risk manager and project managers
¹ Risk review check-in	Frequently	Varies	As per usual

Table 3-1. Meeting Plan for Effective Risk Management Communications

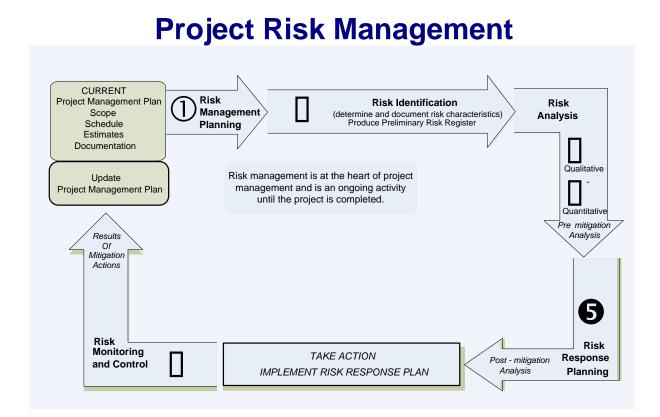

¹At various project meetings, control meetings et al; the topic of risk should be on the agenda. These meetings serve as check-in to communicate with project staff how risk management is going and inform them of the status and progress on risk management.

This risk management effort consistent with the guidance provided in the USDOT Federal Transit Administration "Oversight Procedure 40 – Risk and Contingency Review" and the "Project Risk Management, Guidance for WSDOT Projects" posted at: http://www.wsdot.wa.gov/publications/fulltext/cevp/ProjectRiskManagement.pdf

In addition, risk management workshops follow the rigorous guidelines established by WSDOT for its Cost Estimate Validation Process (CEVP) workshops as expressed in WSDOT Guidelines for CRA-CEVP Workshops 2010-March and posted at: http://www.wsdot.wa.gov/publications/fulltext/cevp/WorkshopGuidelines.pdf

WSDOT uses a sophisticated risk management system, an Access database, to manage risks and have current information on project risks at all times for the project team. This tool has also been utilized at other major projects within WSDOT, such as the Alaskan Way Viaduct and the SR 520 Floating Bridge.

Figure 3-1. Project Risk Management Flowchart (general)

3.1 Risk Management Planning

① Risk Management Planning

The Level of Risk Assessment for the Columbia River Crossing program and its component projects is met or exceeded as determined through E 1053.00, Executive Order for "Project Risk Management and Risk Based Estimating".

3.2 Risk Identification

② Risk Identification

Focus on significant critical risks that affect project objectives; this may be accomplished by establishing minimum thresholds for risk events (minimum dollar and time durations that warrant formal listing and consideration). Identified risks are described and recorded in a risk register beginning early in project development. The risk register is reviewed and updated regularly; see Appendices for a copy of the active Risk Register. The risk register is maintained and kept in a state of readiness for workshops and to respond to inquiries about status of program and project risks.

Identified risks will be described in detail and include:

<u>Identification number for each risk</u>; (see Appendices of this document) a unique number will be assigned to each risk for tracking purposes. Unique identifier numbers will be assigned to each risk utilizing the standard FTA Risk Categories and Standard Cost Categories, SCC and WSDOT Risk Breakdown Structure (RBS). This provides a consistent and convenient way to track risks at an appropriate level of detail; and allows for the development of a risk database by category.

Date when the risk and the activity the risk affects were identified;

<u>Name of the identified risk event</u>; a descriptive title or name for each risk will be recorded.

<u>Detailed description of the risk;</u> each identified risk will be described with information that is Specific, Measurable, Attributable, Relevant and Time bound (SMART). The description will be clear enough and thorough enough so that others reading it will be able to understand the risk.

<u>Risk Trigger</u>; each identified risk must include the risk trigger(s). Risks rarely just suddenly occur; usually there is some warning of imminent threat or opportunity. These warning signs should be clearly described and information about the risk trigger should be documented.

Risk Type; document whether the risk affects project schedule, cost or both.

<u>Potential Responses to Identified Risks</u>; document, if known, possible response actions to the identified risk –can a threat be avoided, reduce, transferred, mitigated or accepted? - can an opportunity be exploited, shared, enhanced or accepted?

<u>FTA Risk Categories</u>; Risks are characterized as belonging to any of the following categories; Requirement, Market, Design, and Construction (See Definitions). For detailed descriptions of FTA risk categories, visit *FTA Oversight Procedures 40 – Risk and Contingency Review Section 6.3*. Below are the FTA risk categories (Requirements, Design, Market, and Construction) with examples as of November 13, 2012:

3-4 Risk and Contingency Management Plan Draft Report

Design Risks (56 active design risks); Currently there are extensive partnering and outreach efforts to reduce risks associated with design changes. The top key design risks are provided below:

	SCC Code	Risk Title
	40.05	Added aesthetics costs
RC.I	RC.STG.10.02	There is an increase to the aesthetic costs/context sensitive solutions for Columbia River Bridge, both structural and non-structural caused by stakeholder input.

Actively manage work of architect involved in RFP development to ensure that RFP aesthetic requirements are detailed, reasonable and cost-effective. Putting an explicit limit into the RFP may reduce the likelihood of this risk occuring. 10-17-2012 F. Green The aesthetic improvements could also be structural in nature.

7/18/2012 Frank Green to monitor - mitigate/active manage architect work to insure requirements are met and are reasonable and cost effective.

Current project risk ranking: 8 Current program risk ranking: 8

10.04 & 40.05	Design may not be able to mitigate parking loss or access to covered parking for building adjacent to southernmost platform in Vancouver.
RC.RC.STG.10.06	River Crossing structure type changes through Alternative Technical Concept process
Current leadership guida money on the river cross Reviewed 10-17-2012 n	5
Reviewed 10-17-2012 II	o change.
Current project risk ran	king: 9 Current program risk ranking: 9

<u>Market Risks (8 active market risks)</u>: Long lead items have been identified to expedite the procurement process and phasing is being analyzed to allow for the implementation of large, small and specialized construction packages. In addition the specifically identified risk events the model analysis also captures the fact that things can go better than planned when bids are submitted (reflecting a favorable/highly competitive bidding environment) or things can go worse than planned when bids are submitted (reflecting a less favorable/less competitive bidding environment).

SCC Code	Risk Title
10.10.01	Uncertain market conditions for track: Steel material price fluctuations
10.12.01	Uncertain market conditions for track: Special switches and turnouts
10.12.02	Track: Special switches and turnouts exceed escalation

<u>Construction Risk</u>: The project has a high level of construction complexity. Depending on the contracting option selected many of these risks may be transferred to the contractor. However, the project will still monitor these risks to ensure that the contractor is mitigating them appropriately. A majority of these risks originate from the tight working conditions within the corridor and downtown Vancouver as well as Hayden Island and the necessary sequencing of activities to complete the CRC project within the tight project and budget constraints.

SCC Code	Risk Title
40.02.08	City of Vancouver requires undergrounding of utilities
	Drilled shafts need to be deeper than 150'/130' in the vicinity of Marine Dr. and Hayden Island due to differing geotechnical conditions
60.02.05	Condemnation is necessary

<u>Contract Packaging Risk Identification</u>; Delivery methods and contracting risks are largely tied to issues surrounding contracting strategy and the management and oversight of contractors.

A unique Risk Identification Numbering system is used to identify CRC project risks. The identification of risks employs an agile system with standard risk breakdown structures for highway construction by used by WSDOT and also FTA risk categories and SCC codes. Figure 3-2 depicts how each risk has a unique identifier Figures 3-3 and 3-4 illustrate the definitions of these coding systems. Figure 3-5 provides a flowchart for risk identification. Risk identification can take place anytime; this can occur at formal workshops or anytime in between. Table 3-1 lists the Standard Cost Code (SCC) categories defined by FTA and used in the risk identification system for the CRC project.

Table 3-2. SCC Categories 10-100

SCC
10 Guideway and Track Elements
20 Stations, Stops, Terminals, Intermodal
30 Support Facilities: Yards, Shops, Admin. Bldgs
40 Sitework and Special Conditions
50 Systems
60 Row, Land, Existing Improvements
70 Vehicles
80 Professional Services
90 Unallocated Contingency
100 Finance Charges

Figure 3-2. Risk Identification Numbering System (EXAMPLE)

3.2.1 FTA Risk Category Descriptions

Requirements Risk (RQ)

Risks that relate to the establishment and variability of fundamental goals and conditions of a project to which the design must respond; also the activities of the Grantee to actively identify these goals and conditions. Generally, a requirements risk is associated with all project development activities from earliest concept through Alternatives Analysis. A significant portion of Requirements Risk can be attributed to the potential influence of project stakeholders if project goals and requirements are not fully defined.

Design Risk (DS)

Risks associated with the performance and variability of design related activities occurring after Alternatives Analysis. Substantially complete design risk is indicated when no material design-related non-conformances are detected through the scope review; the estimate review indicates that 95% of all construction direct cost activities are shown on both design deliverables and cost estimate; and the schedule review indicates that no project level critical path element or procurement activity exceeds 45 calendar days.

Market Risk (MK)

Risks related to the procurement of construction services, materials, equipment and the variability associated therewith. This risk refers to both the effects of the open-market pricing of goods and services, as well as the effects of the Grantee's contract packaging strategies.

Construction Risk (CN)

Risks that consider the inevitable variability of the project's environment –including such items as unusual weather, unexpected subsurface conditions, and unexpected contractor failure –as well as performance risk that is manageable by the Grantee and its consultants and contractors – for example uncertainty surrounding the mobilization of a tunnel boring machine and its planned production rates. Construction risk is subdivided into: Early Construction Risk (composed of Geotechnical/Utilities activities, usually associated with 20% complete), Mid-range Construction Risk (associated with coordination of contractors, etc.), and Start-Up/Substantial Completion Risk (associated with 90% complete).

3.2.2 FTA Primary Mitigation Risk Categories (see Chapter 5)

Primary Mitigation:

- Technical Capacity
- Project Scoping and Design;
- Delivery Methods and Contracting;
- Construction Process;
- Project Tracking, including:
 - Cost Estimating, Financing and Financial Management; and
 - Project Schedule Management.

3.3 Qualitative Risk Analysis

^③ Qualitative Risk Analysis – can be used as a tool for screening risk to make sure we use resources effectively by focusing on risks that are most critical to project objectives. This tool is employed during risk identification when we establish minimum thresholds for risk events. Also when communicating risks many find a visual presentation more intuitive than narrative descriptions and numbers, hence risks can be depicted in a qualitative risk matrix and an example from Project Risk Management Guidance for WSDOT Projects is provided below:

Chapter 3

```
Qualitative Risk Analysis
```

EXAMPLE (depicts a simple list of risks evaluated and ranked qualitatively)

Qualitative Risk List

count	T/O	RBS #	Risk Title	Probability	Impact
а	Т	ENV 30.1	Permits and Permit Appeals	Medium	High
b	Т	UTL 20.1	Unidentified Utility Conflicts	High	Very High
с	Т	STG 20.4	Change to Substructure Assumptions	Very Low	Low

		с		Very high	Very Critical	Very Strong	<u>≥</u> 10%
VL				High	Critical	Strong	8%
	VL	L M Impact	н үн	Medium	Moderate	Average	4%
		inpact		Low	Slight	Mild	2%
						Very Mild	<u><</u> 1%

¹Suggested percentages; project teams may adjust if they desire.

Source: Project Risk Management Guidance for WSDOT Projects, July 2010 page 28

3.4 Quantitative Risk Analysis

④ Quantitative Risk Analysis – Once risks are identified and have been screened via qualitative analysis, they can be analyzed quantitatively. Recall that identification includes a thorough description of the risk and risk triggers. With quantitative analysis the probability of occurrence and consequence if the risk event occurs must also be documented.

3.5 Risk Response

G <u>Risk Response</u>

<u>Critical risks must be met with vigorous response actions;</u> lower ranking risks should receive response actions commensurate with their significance.

The output from the analysis provides a ranked risk register with the risks of greatest significance to project objectives determined. Apt response actions to significant risks must be cost effective and realistic.

Risk owner

For each risk a risk owner is appointed, the risk owner decides on possible response actions to implement and insures that the selected response is documented and incorporated into the appropriate work plans and integrated into project management plan updates as appropriate.

Documentation of Response Actions

Document the response action by describing the action, which work activities it will affect and the cost of the response action. Identify the person(s) responsible for successful implementation of the response action. Also consider the time impacts of the response action and how the risk response may affect the overall project and/or other risks.

<u>Take action</u> in response to identified risks. The project teams will implement the response plans focusing on risks of most significance, in order to shift the odds in favor of project success.

Risk Response requires effort to develop and implement response actions; we plan for this effort in the risk management section of our project management plan. We will also be holding a workshop with the FTA to discuss actions to be taken to mitigate risks identified, ensuring full integration and agreement as risks are resolved.

Descriptions of risk response actions:

Actions in response to risk:	Threats	Opportunities
	1. Avoid	1. Exploit
	2. Transfer	2. Share
	3. Mitigate	3. Enhance
	4.	Accept

The next three sections of this Risk and Contingency Management Plan (RCMP), sections 3.5.1, 3.5.2, and 3.5.3 describe available response actions to identified risks. The descriptions of the response actions reflect the type of action that will occur with each of the identified responses for threats and opportunities and of course what it means to "accept" a risk. The Project Management Body of Knowledge (PMBOK) was referred to for developing the descriptions for threat and opportunity responses and a book titled "Effective Opportunity Management for Projects" by David Hillson was referred to when developing the description for "accept."

3.5.1 Risk Response Actions (threats)

AVOID (*threats*) - Action taken to insure the probability or impact of a threat is eliminated. Avoidance actions include: change the project management plan to eliminate a threat, to isolate project objectives from the risk's impact, or to relax the project objective that is in jeopardy, such as extending a schedule or reducing the scope. Some risks that arise early in the project can be avoided by clarifying requirements, obtaining information, improving communication, or acquiring expertise.

TRANSFER (*threats*) - Action to allocate ownership for more effective management of a threat. Transferring a threat does not eliminate it; the threat still exists; however, it is owned and managed by another party. Transferring risk can be an effective way to deal with financial risk exposure. Transferring project risk almost always involves payment of a risk premium to the party taking the risk. Examples include: insurance, performance bonds, warranties, etc. Contracts may be used to transfer specified risks to another party.

MITIGATE – or reduce (threats) - Action to reduce the probability and/or impact of a threat. Risk mitigation implies a reduction in the probability or impact of an adverse risk event to an acceptable threshold. Taking early action before the risk has occurred is often more effective than trying to repair the damage afterward. Examples of mitigation strategies include: adopting less complex processes, conducting more tests or field investigations, or developing a prototype. One measure to address an impact can be to target linkages that determine the severity, such as designing redundancy into a subsystem. Redundancy may reduce the impact from a failure of the original component.

3.5.2 Risk Response Actions (opportunities)

EXPLOIT (opportunities) - Action taken to insure the benefit of an opportunity is realized. This strategy is the opposite of 'avoid.' The strategy is intended to insure a positive impact; an opportunity is realized by taking action to make certain the opportunity happens. Such response actions include: assigning appropriate resources to a project to reduce cost or time to complete.

SHARE (opportunities) - Action to share with a third party; enhance or exploit an opportunity. Sharing a positive risk involves allocating ownership to a third party who is best able to capture the opportunity for the benefit of the project. Examples of sharing actions include forming risksharing partnerships, teams, or joint ventures, which can be established with the express purpose of managing opportunities.

ENHANCE (opportunities) - Action to enhance opportunity.

This response increases the benefits of an opportunity by increasing the probability or impact. This strategy seeks to facilitate or strengthen the cause of the opportunity, and proactively target and reinforce its trigger conditions. Impact drivers can also be targeted, seeking to increase the project's susceptibility to the opportunity.

3.5.3 Risk Response Actions (acceptance)

ACCEPT - Action taken to document the acceptance of the risk.

The term "accept" refers to risks that remain after response actions, or for which response is not cost effective. This strategy simply means that a decision has been made to live with the consequences of the risks should they occur. Risks that are uncontrollable are 'accepted'; no response actions are realistically available.

3.6 Monitoring and Control

6 Monitoring and Control

Monitoring Primary Mitigation (also see chapter 5)

After we have implemented response actions, we track and record their effectiveness and any changes to the project risk profile. We report on the response actions and whether they have had a positive or negative effect on achieving project objectives. This becomes an ongoing effort of monitoring and controlling project risks.

<u>Response tools and strategies are wide and varied</u>, effective response actions frequently involve enhanced communication and coordination. Regular updates of project schedules, estimates and review of work activity sequencing with the project team and support groups fosters openness and transparency. These reviews contribute to good working relationships and opportunities to resolve issues and explore risk response actions.

While there are things we do not control that can affect project development and delivery we do have control over our state of readiness, we can look ahead and improvise and adapt. We can control the robustness of our response to identified risk events and the quality of our documentation. We have control over how earnestly we integrate risk management into our project management plans. We control monitoring and reporting capabilities.

Monitoring and controlling risk involves observing and reporting on the following:

- Risk response actions that have been implemented and carried out;
- Performance of the response actions (cost of response, estimated risk reduction, and effectiveness);
- If a risk trigger has occurred or appears imminent;
- Residual risks that remain after response actions;
- New risks that have not previously been identified;
- Project assumptions are still current and correct;

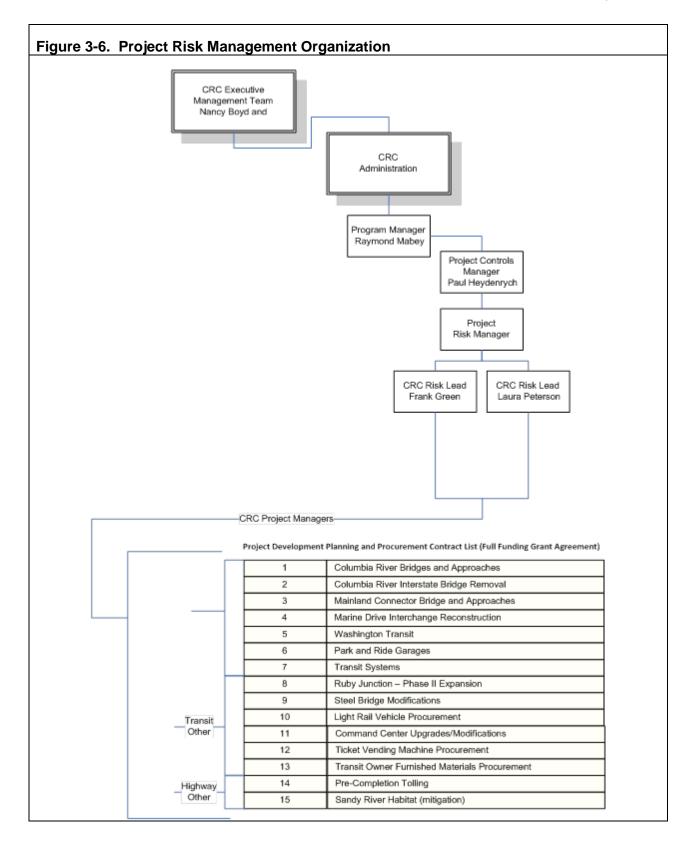

3-16 Risk and Contingency Management Plan Draft Report

As we continue through project development the project risk profile will change. Typically as we successfully respond to risks and our project knowledge increases our risk exposure will diminish. In effect we can retire risk reserve as risk events are successfully avoided or mitigated or we have passed the time during which the risk is active and it becomes retired.

Documentation of Monitoring and Control

Monitoring and controlling project risk involves determining whether a project is tracking to plan or deviating in a negative manner. This will require a blend of qualitative judgments and quantitative measures to determine the "health" of the project delivery effort.

Risk response actions are evaluated and implemented, if the response action involves a change, the change will be implemented following the procedures in Section 3.6.3 of the Project Management Plan for the Columbia River Crossing project. Figure 3-6 depicts the Project Risk Management Organization.

Roles

Public (as represented by Legislatures)

• The CRC is obligated to managing risk and contingency while being financially responsible to the greater good of the public as determined by the legislature.

CRC Director and Executive Leadership Responsibilities (full time)

• Promote and provide support for active project risk management.

CRC Risk Manager Responsibilities

- Direct and manage day-to-day risk management process for the project including regularly schedule risk management and review meetings as proposed in section 4.
- Prepare and update the project risk management plan, including: schedule for key check-in milestones for the risk management plan, risk workshops; insure quality of risk data and analysis.
- Work with Strategic Analysis and Estimating Office to coordinate pre-workshop, workshop and post-workshop activities, including internal and external participants.
- Track and monitor effectiveness of risk response actions.
- Promote risk management activities within the project team and with stakeholders.
- Communicate with project managers on all matters related to risk management including:
- Review of response actions.
- Confirm deadlines for response implementation.
- Revise and update risk response plan as appropriate.
- Revise and update risk registers as appropriate.
- Work with directors when key risk-related program level decisions are needed.

Project Managers (full time)

- Promote aggressive risk management for their projects and participate in risk workshops.
- Manage active risks for their project/either serve as the risk manager for their project or designate an appropriate person to fill this roll for their team.
- Manage use of contingency risk reserve for their projects; obtain director approval for contingency risk reserve that exceeds their authorized limit.

- Review and endorse the project risk management plan and updates.
- Review and monitor response actions particularly for significant risks.
- Communicate to senior management about the project risk and response actions.

Risk Owner (Action Owner) (full time to project/as needed to the risks they own)

- Implement agreed upon response actions.
- Report on effectiveness of responses to the project manager/risk manager and affected project team members; including the need for additional risk response actions.
- Identify new risks that may emerge after response actions.

Project Team Members (full time to project)

- Maintain a state of risk awareness for the project.
- Document actions and report to project risk manager for risk management updates.
- Monitor response actions and document how it affects project design and development.
- Communicate with project manager about risk management actions and changing project key risks (addition of new risks or retirement of old risks –as appropriate).

3-20 Risk and Contingency Management Plan Draft Report

This page left blank intentionally.

4. Insurance

4.1 Overview

This chapter conforms to the Columbia River Crossing (CRC) Risk and Contingency Management Plan (RCMP). Consistent with the Federal Transit Authority (FTA) Oversight Procedures 40 (OP 40) document, this Chapter of the RCMP and Chapter 5 of the PMP includes a summarized discussion of current or future major insurances, for the Columbia River Crossing program.

WSDOT is the grantee for FTA's transit grants and serves as a co-lead agency with ODOT for the overall multimodal project. In the Program organization, Insurance and Risk Management, is the responsibility of the Director of Project Controls. WSDOT, the grantee, organizes program risk management into two areas of responsibility: Enterprise Risk Management and Project Risk Management.

The Enterprise Risk Management Office (ERMO) of WSDOT provides a variety of services to help with a wide range of insurance, risk and legal issues. Enterprise risk management deals with the risk transfer and finance mechanisms associated with insurable risks.

In consultation with WSDOT, ODOT and TriMet Risk Management, Enterprise Risk Management is responsible for evaluating, administering and coordinating the insurance and claims for the program, which includes:

- Identifying the loss exposures and evaluating the best methods to protect the interests of the project and agencies.
- Determining the appropriate coverage types and limits.
- Developing and administering a claims management program to coordinate property, liability and workers compensation claims, including property damage recoveries.
- Conducting risk analysis.
- Managing CRC's Insurance program, monitoring the contractor insurance program.
- Assisting in litigation management.
- Reviewing contracts, lease agreements and other legal documents for assumption and transfer of risk.

The CRC Program will take the necessary actions to protect against risk in a fiscally responsible manner and to coordinate the insurance needs of the agencies.

This RCMP describes how the team will deal with uncertainty and risks that affect project objectives, most notably cost and schedule. Project risk management is an ongoing and integral part of project management and is performed throughout the life of the project.

The Risk Manager, in cooperation with the Deputy Transit Manager, provides leadership and guidance to various agency staff from WSDOT and ODOT (co-lead agencies) and partnering transit agencies (TriMet and C-TRAN) and is responsible for the day-to-day coordination of the following activities:

- Identifying the best method to protect WSDOT, ODOT, TriMet, and C-TRAN from risk exposures due to the CRC Program.
- Determining the degree of indemnification and/or insurance protection requirements for consultants and contractors providing services to the CRC.
- Preparing and implementing the Risk and Contingency Management Plan (RCMP).

4.2 Risk Management

The WSDOT Cost Estimation Validation Process (CEVP) and FTA Risk Assessment (RA) are tools that help us identify and manage risks on a particular project. These processes are further defined in the other chapters of this RCMP. Risk registers include both cost and schedule attributes which are included in an integrated model for analysis. Key risks identified for CRC are quantified for both cost and schedule. These risks are identified, defined, quantified, and analyzed to effectively use resources in response to risks.

The risk review process and development of a risk management plan include the following steps:

- Risk Management Planning.
- Risk Identification.
- Analyses of risks (Qualitative and Quantitative).
- Risk Response (analyses of risk treatment alternatives, i.e., avoidance, prevention, mitigation/cost control, and insurance).
- Assignment of risk.
- Selection of risk treatment.
- Monitoring and evaluating performance of the chosen risk treatments.

The main objective of the CRC program is to respond to identified threat risks and make the most of opportunities. The CRC team will manage risks for each of its projects and provide rapid updates throughout program delivery. The information the team will manage includes:

- Risk profile (program level and project level).
- Status of key significant risks (monitor and control capabilities):

- Response actions taken.
- Cost of response actions.
- Results of response actions.
- Current status of risk (active, retired).
- Summary of risk management efforts and outcomes.

This RCMP describes areas of risk assessment focus that were identified through the risk review process completed during the Preliminary Engineering phase and that will continue to be implemented throughout the life of the project. The RCMP for the CRC Program is consistent with WSDOT, ODOT, TriMet, C-TRAN, and FTA processes and standards. RCMP components (as listed in the Table of Contents of this document):

- 1. Overview summarizes how the RCMP fits into the overall project management plan.
- 2. Goals and Objectives for risk and contingency management for CRC.
- 3. Risk Review Process procedures which describe risk identification, risk assessment, risk response, risk protection measures (such as Secondary Mitigation and minimum contingencies) and risk management and control.
- 4. Insurance –summarizes use of insurance at CRC (see also chapter 5 of the PMP).
- 5. Primary Mitigation describes *response* actions to mitigate the impact of identified key risks.
- 6. Contingency Management describes cost and schedule contingency protections including contingency recommendations and management of cost contingency and schedule contingency.
- 7. Secondary Mitigation describes the use of secondary mitigation and a list of items and timing necessary for implementation of secondary mitigation actions.
- 8. Risk Management and Risk Mitigation –describes administration and maintenance of this RCMP, including:
 - a. Identification and analysis of project risk;
 - b. Risk response options (primary and secondary);
 - c. Risk monitoring and control;
 - d. Documenting and reporting to FTA.
 - e. Design control processes;
 - f. Plans for updating the risk register;
 - g. Plans and timing for updating the RCMP.

WSDOT will treat risk analysis separately from the base cost estimates during Engineering (Final Design). This allows a more rigorous and objective approach to this important component

4-4 Risk and Contingency Management Plan Draft Report

of the CRC Program, and includes anticipated variances in the base cost (for example, in unit costs and quantities) and the impact of risk events.

Active risk management includes convening risk workshops, updating the risk register, identifying and quantifying new risks, and ensuring that risk response strategies are successfully implemented. Workshops are typically conducted annually until contracts are awarded. The Risk Owner assigned to each risk will monitor the effectiveness of the current risk management strategy, assess any unanticipated effects, and recommend any mid-course corrections to the CRC Management Team.

In addition, in the risk register, risks are identified as "owner", "contractor", or "shared" with respect to where the risk most appropriately resides. In March of 2013 a workshop was held that reviewed and validated the allocation of the Design-Build contract risks as owner, contractor or shared. As new risks are identified this allocation will be included as part of the information in the risk register for the identified risk.

The WSDOT Cost Risk and Estimate Management (CREM) office developed a spreadsheet to track risk and modified it for transit elements. This spreadsheet offers a preliminary understanding of how to avoid or mitigate for risks if they occur. Proper tracking of risks helps internal and external communication among partners, stakeholders, the CRC Program's managers, and staff as well as independent teams at risk workshops.

4.3 Enterprise Risk Management

WSDOT's program risk management is broken down into two areas of responsibility – Enterprise Risk Management and Project Risk Management. Project risk management is discussed in detail in this document.

Enterprise risk management deals with the risk transfer and finance mechanisms associated with insurable risks. In consultation with WSDOT, ODOT, and TriMet Risk Management, Enterprise Risk Management is responsible for evaluating, administering, and coordinating the insurance and claims for the Program, including the following:

- Coordinating insurance requirements between TriMet, ODOT, and WSDOT by the following:
- WSDOT Enterprise Risk Management Office (ERMO), guide by the Enterprise Risk Management Manual, M 72-01, October 2012.
- ODOT Department of Administrative Services, Procurement Office, Insurance and Procurement Manager.
- TriMet
- ²Claims will be processed through the appropriate offices as delineated in the ³interagency agreements and contracts.

² Claims include, but are not limited to, Tort claims, Recovery claims, and insurance.

³ Interagency agreement includes WSDOT, ODOT and TriMet.

- Indemnifying the loss exposures of the CRC Program and evaluating the best methods to protect the interests of the project and agencies.
- Determining the appropriate coverage types and limits.
- Developing and administering a claims management program to coordinate property, liability, and workers compensation claims, including property damage recoveries.
- Conducting risk analysis for insurance coverages.
- Managing the insurance program, including monitoring the contractor insurance program.
- Assisting in litigation management.
- Reviewing contracts, lease agreements, and other legal documents for assumption and transfer of risk.

The CRC Program will consult with professionals, knowledgeable in the field of insurance, to take the necessary actions to protect against risk in a fiscally responsible manner and to harmonize the insurance needs of the agencies during the preparation of the Request For Proposal, RFP and other procurement documents for approved project packages.

4.3.1 Insurance

Insurance is one of the risk transfer and finance mechanisms for CRC Program loss exposures. Given the various contracting agencies and packages, and the unique loss exposures of the project, the project is approaching risk financing in a thoughtful, diligent manner. The Program will coordinate with the WSDOT, ODOT, and TriMet Risk Management groups to develop and enforce contract indemnification and insurance requirements to protect against loss. During Engineering (Final Design) and prior to issuing the RFQ/RFP, the Program will work with the WSDOT, ODOT, and TriMet Risk Management groups to study the best method of protecting the Program and the contracting agencies. This review process will give the project team a thorough understanding of the loss exposures and identified risks associated with each contracting package.

The Program will evaluate risk transfer and finance through:

• All appropriate insurance cover types and amounts. During development of the RFP legal and Insurance Professionals will review the language regarding insurance coverage.

As described in Chapter 5 of the Project Management Plan (PMP), minimum insurance coverage types may include, but are not limited to:

Workers' Compensation	Commercial General Liability
Automobile Liability	Environmental Liability
Excess Liability	Railroad Protective Liability
Builder's Risk	Marine Liability
Aircraft Liability	Verification of Coverage
Contractor's Protective Liability	Endorsements and Waivers
Subcontractor Insurance Requirements	Changes in Requirements
Waivers of Subrogation	Support of Indemnifications
No recourse	Grantee's Right to Remedy Breach
Commercial Unavailability Alternatives	Claims Relating to Differing Site Conditions
Insurance Proceeds and Prosecution of Claims	Disclaimer
Commencing of Work	
Revenue disruption for tolling due to catastrophic loss	
Professional Liability (including consideration of design	errors and multistate inspection)

Insurance will be consistent with:

TriMet standard practices for insurance requirements on contracts. WSDOT Standard Specifications M41-10, Chapter 1-07, 2012. ODOT/APWA Oregon Chapter, Volume 1, 00170.70. Interagency Agreements.

4.3.2 Preconstruction Surveys

It is anticipated that the Design-Builder will require a pre-construction survey to examine and monitor select buildings, utilities, and underground structures within areas potentially influenced by CRC Program's construction activities. The preconstruction survey will assess and record any existing cracks or damages, and provide a preconstruction record of the facilities in the event that any damage is claimed as a result of the CRC Program's construction activities. During construction, if any deep excavations adjacent to existing structures are required, the vibration consultant may use ground movement monitoring instruments. The need for any such instrumentation will be decided through discussions with the project engineer and the structural engineer. Post-construction surveys may also be conducted if there are reasons to believe that damage may have occurred or if a claim is filed.

5. Primary Mitigation

This chapter describes how the CRC team will take action in response to identified risks by focusing on risks of most significance. Primary mitigation is achieved through continuous risk management and risk response. This chapter also highlights the top risks at the time of writing this RCMP.

5.1 Technical Capacity and Capability

Technical Capacity risks identified for the CRC project are related to workforce and management limitations as well as turnover of staff. We are currently monitoring one active Technical Capacity and Capability risks, listed below in Table 5-1.

5.2 Requirements Risks

Requirements risks relate to the establishment and variability of fundamental goals and conditions to which the project design must respond, as well as the Grantee's activities to identify these goals and conditions. A number of requirements risks have been identified for this project and will be reviewed and quantified at subsequent Cost Estimate Validation Process workshops.

There are 35 active requirements risks. Three of the more significant active requirements risks, identified for the CRC project, are listed below in Table 5-2, followed by detailed risk identification sheets for these risks.

Tuble e El Require	
WT.WT.MGT.30.01	Failure to obtain C-TRAN O&M funding commitment in a timely manner

5.3 Design Risks

Design risks are associated with the performance and variability of design-related activities occurring after alternatives analysis. There are 55 active design risks, three of the more significant design risks, identified for the CRC project, are listed below in Table 5-3.

Table 5-3. Design Risks

Tuble 0 0. Deolgi	
RC.RC.ENV.30.04	USACE 408 navigation channel authorization may require additional design information on the main river crossing or harbor bridges than currently available
RC.RC.STG.10.02	An increase to the aesthetic costs/context sensitive solutions for Columbia River Bridge, both structural and non-structural caused by stakeholder input.
RC.RC.CTR.10.02	Project is redesigned to accommodate new staging/phasing.

5.4 Delivery Methods and Contracting Risks

Delivery Methods and Contracting risks are largely tied to issues surrounding contracting strategy and the management and oversight of contractors. This is an area of ongoing examination and consideration on the CRC project. One key opportunity risk was identified as summarized below in Table 5.1-4, a detailed risk identification sheet for this opportunity is provided on the following page.

5.5 Construction Process Risks

Construction Process risks include risks that are due to the inevitable variability of the project's environment—including such items as unusual weather, unexpected subsurface conditions, and unexpected construction contractor failure—as well as performance risk that is manageable by the Grantee and its consultants and contractors—for example uncertainty surrounding mobilization and planned production rates. This is an area of ongoing examination and consideration on the CRC project. There are 18 active construction risks. Three of the more significant construction risks, identified for the CRC project, are listed below in Table 5-5.

RC.RC.CTR.10.02 Local partner	rs not agreeing on access restrictions
RC.RC.CTR.900.07 Differing site	e conditions for foundations
RC.RC.CTR.90.1 Interfaces wit	th other projects could lead to contractor conflicts

Table 5-5. Construction Process Risks

5.6 Project Tracking Risks

Project Tracking risks relate to the tracking and forecasting of cost and schedule outcomes. This area of risk on the CRC project is includes *Cost Estimating and Forecasting*, and *Schedule Management* risks. There are 9 active risks of this type currently identified for the CRC project There are 18 active construction risks. Two of the more significant project tracking risks are listed below in Table 5-6.

The CRC project maintains a register of identified risks and the probabilities and impacts associated with them; these impacts are estimated in terms of both cost and schedule. The Monte-Carlo analysis that we perform uses an integrated model that includes both schedule and cost impacts. These risks are evaluated and the top risks for cost and schedule receive the greatest attention for response actions (mitigation).

5.7 Top Active Risks Cost and Schedule

The following page provides information on the top active risks.

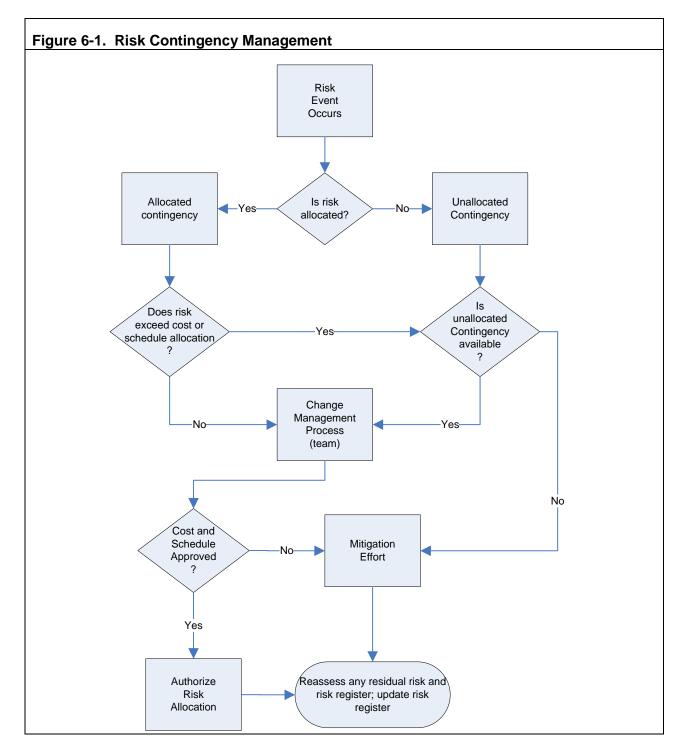

A current risk register of all risks is provided in the appendices of this document.

ble 5-7. Top Active Cost Risks <u>Top Risks</u>	Impacting C	ost		
Risk		Cost (\$M)	Schedule (MO)	Risk Owner
1. RC RC ROW 20.02	Pre-Response Expected Value	\$17.100	0.00	Delema Mil

4. RC RC CTR 10.02	Pre-Response Expected Value	\$ 9.780	2.00	
Project is redesigned to accommodate new staging/phasing.	Post-Response Expected Value	\$8.980	0.20	Niemi, Miko
5. MC MC STG 10.04	Pre-Response Expected Value	\$1.922	2.00	
Late changes caused by stakeholder comments, City of Portland Design Review, and discoveries during final design.	Post-Response Expected Value	\$1.922	0.80	Wills, Heath
6. MC MC DE S 10.02	Pre-Response Expected Value	\$1.765	1.88	
A realignment of Expo South Access is required	Post-Response Expected Value	\$1.765	1.88	Liles, Case
7. RC RC MGT 30.03	Pre-Response Expected Value	\$2.239	1.55	Devel News
FTA rejecting toll revenues as a budgeted funding source	Post-Response Expected Value	\$2.239	0.52	Boyd, Nanc
8. RC RC ENV 30.04	Pre-Response Expected Value	\$9.620	1.30	M2- 11
USACE 408 navigation channel authorization may require additional design information on the main river crossing and/or harbor bridges than currently available	Post-Response Expected Value	\$9.620	0.40	Wills, Heath
9. RC RC ROW 900.01	Pre-Response Expected Value	\$ 0.633	1.13	Deles Mil
Agreement issues between FHWA and FTA on shared parcels	Post-Response Expected Value	\$ 0.633	1.13	Palazzo, Mike
0. RC RC ROW 60.02	Pre-Response Expected Value	\$0.474	1.13	Deleger Miles
Late discovery of the need to acquire additonal property due to ground improvements on Hayden Island and Marine Drive	Post-Response Expected Value	\$0.474	1.13	Palazzo, Mike

6. Contingency Management

Figure 6-1 provides a flowchart of the contingency management process for CRC.

This chapter describes how CRC contingency reserves are established for both cost and schedule. The mechanism established to draw down, or reduce, the contingency reserve as risks expire, and the process adopted to transfer funds from the contingency reserve to the baseline cost estimate should risks materialize or funds are committed to mitigate risks.

Costs will be managed to the escalated (or year-of-expenditure) *base cost estimate* prior to contract award. After contract award, costs will be managed to the amount of the successful bid.

Currently, CRC has identified contingency draw-down at the program level. As the project progresses and specific contract packages are defined contingency draw-down curves for specific project contract packages can be established.

6.1 Establishing Cost Contingency

The Columbia River Crossing program currently has two contingency pools which are funded under separate Work Identification Numbers (WINs). One contingency WIN is for the Transit Contingency and is to be shared by the associated Transit contracts in the project. The other contingency WIN is for all other portions of the CRC program and is to be shared by the associated projects that comprise this work.

Cost contingency is reported as a dollar value and as a percentage of the escalated base cost described under "Definitions" in the preamble to this plan. When construction contracts are awarded, the *base cost estimate* is replaced by the successful bid. Schedule contingency is reported in days.

The total contingency, for each contingency pool, is comprised of two parts. One is the allocated contingency, which will be allocated to risks that were identified and listed in the risk register, (risk and uncertainty that is integral to the Grantee's CEVP). The other is unallocated contingency which represents unknown risks.

Allocated contingency is a measure of known risks on both budget and schedule, as identified in the risk register. Risk and uncertainty is initially developed by the CRC team, and further expanded and validated through the CEVP. Each risk is associated with an item on the project schedule and, as such, has a date at which it becomes active and a date after which it becomes inactive and can be retired.

The allocated contingency is the difference between the escalated base cost or base schedule and the total project cost or risk-loaded schedule, respectively, with a specified percentage likelihood of occurrence based on the CEVP modeling output. Appropriate contingency levels are established per the guidance provided by WSDOT and the FTA.

At this stage of development, a single risk or allocated contingency reserve fund will be shared by all components of the CRC program. When specific projects (that is, construction packages) are identified, each will be assigned its own fund based on risks associated with that project

Unallocated contingency is a measure of unforeseen events which, should they occur, would have an effect on budget or schedule. These are unknown events and cannot be managed until known.

The unallocated budget contingency is the difference between the allocated contingency and the total cost contingency levels based on the percentages shown in Table 6-1 for the different phases of program or project development. These are considered to be the minimum desirable levels and may need to be increased at specific milestones depending on the results of the FTA Risk Assessments performed by the PMOC. The unallocated schedule contingency may be set as a percentage of the allocated contingency.

Allocated contingency, by standard practice with WSDOT CEVP analysis is typically established using the 60th percentile figure; however, this can be adjusted as project conditions and management judgment warrants. Unallocated contingency may be added to reach the appropriate recommended minimum contingency from the Federal Transit Authority (FTA) for the project phase (level of development).

	Project Phase	¹ Recommended Minimum Contingency
	Engineering (formerly known as entry to Final Design)	20%
Pre-construction	Full Funding Grant Agreement	15%
	90% to 100% Bid	10%
	50% Construction	5%
Construction	75% Construction	4%
Construction	90% Construction	3%
	Revenue Operating Date	1% to 3%

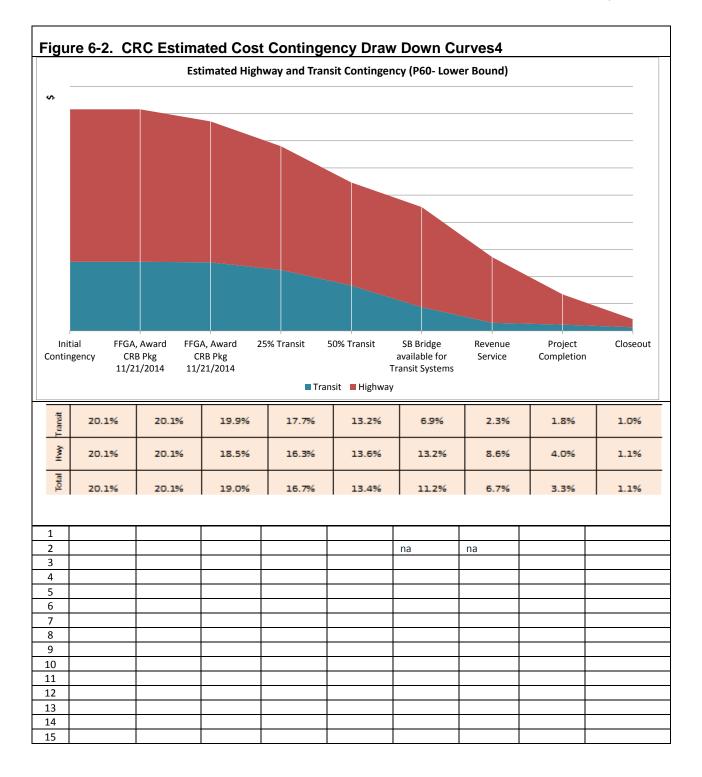

Table 6-1. CRC Contingency Drawdown Levels (Pre-construction and Construction)

¹Source: FTA Oversight Procedure 40 – Risk and Contingency Reserve Section 6.5.4.1 page 14 of 17; Note the source document does not provide a recommended minimum contingency for 75% Construction and 90% construction hence these are included as additional hold points for informational purposes.

Contingencies for cost and schedule will be drawn down over the design and construction of the CRC program as risk events pass, and curves will be developed showing how those contingencies are drawn down at specific to-be-determined milestones. The curves will be updated as necessary, typically at each milestone as a minimum.

The risk or allocated contingency to which the project would be exposed at each milestone will be informed by risk workshops (WSDOT CEVP workshops or FTA Risk Assessment workshops). The risk register developed for the CRC project considers the complexity and location of the project. The following contingency levels are suitable for the CRC project, based on the blended experience of WSDOT and ODOT, an examination of the FTA minimum contingency levels, and research reviews.

The contingency drawdown provided in Figure 6-2, on the following page, establishes the contingency drawdown targets for the CRC project; these curves take into account the unique nature of the project and its blend of transit and highway components. As the project progresses and definition of contract packages emerge more detailed updates will be available.

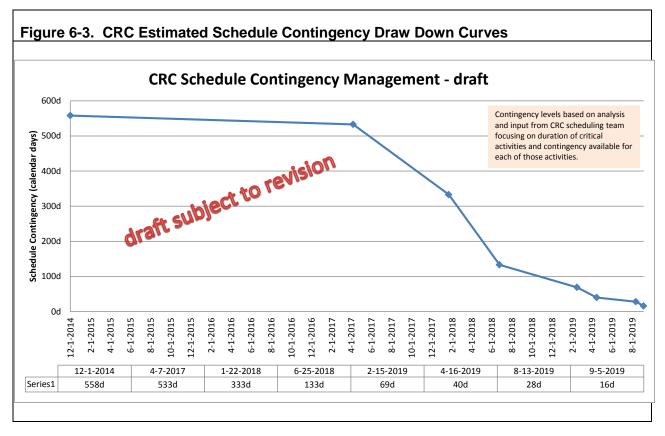

⁴Contingency percentages estimated using the risk profile from CEVP. Per FTA practices the contingency is measured from the estimated Lower Bound figure (P5 used as Lower Bound). Dollar values apply to the 2011 cost estimate for elements comprising the Initial Construction Package (ICP) escalated from Q1-2011 to Q1-2012 dollars using a global inflation rate of 2.8 percent. Hold point values were approximated using Highway and Transit Contingency ratios (P60-P5) as provided by HDR, 2012. Estimated cost allocation is 31% Transit and 69% highway.

The status of the top active cost and schedule risks are summarized in chapter 5; a complete risk register is provided in the appendices of this document

6.2 Schedule Contingency Management

Schedule contingency is identified time to allow for the potential of schedule disruptions or delays. Potential delays are benefit identified as risks in the risk register. Schedule contingency is identified at key milestones, sometimes referred to as "hold points". If contingency is not sufficient, even after primary mitigation actions have been implemented, consideration will have to be given to additional actions. The targeted amount of schedule contingency, for the project as a whole, is 20% of the time from final design to the start of revenue operations. Figure 6.3 depicts a draft estimate of contingency as of 12/3/2012.

NOTE: As with cost there are uncertainties and risks associated with schedule. The ability to cope with schedule variations and potential risks is important for project management. To that end project schedule contingency and management is being addressed and will be presented in a future schedule update.

Schedule Contingency

The project will maintain an estimated schedule contingency of approximately of 20% of the duration of the project from Entry into Final Design (FD) through Revenue Operations. Status of the schedule, and associated contingency will be reviewed as part of the risk management process. The recommended schedule contingency amount was developed through consideration of project conditions. The project will guard against premature use of significant amounts of schedule contingency by regularly reviewing contingency levels at key hold points.

6.3 Managing Contingency Reserves

It is anticipated that the majority of risk items, including right-of-way and construction, will be identified and quantified during the design phases of the project. It is expected that most design risks will be retired by the time that construction contracts are awarded. The Configuration Change Management program will be used to associate the use of the contingency to a specific risk, and funds shall be moved into the contracts as needed to mitigate for risks that come to be realized.

Established reserves, for both cost and schedule impacts of risk events, are intended to provide a guard against schedule delay and a source of funds to cover the impact of risk events that occur and for new risks identified by the CRC team. The cost and schedule contingency reserves will be reassessed in conjunction with each CEVP or Risk Assessment workshop as a minimum and more frequently should the need arise; for example, should there be a significant change in project scope, risk profile, or other changes.

A number of events could take place that would affect the allocated and/or unallocated contingency reserves such as:

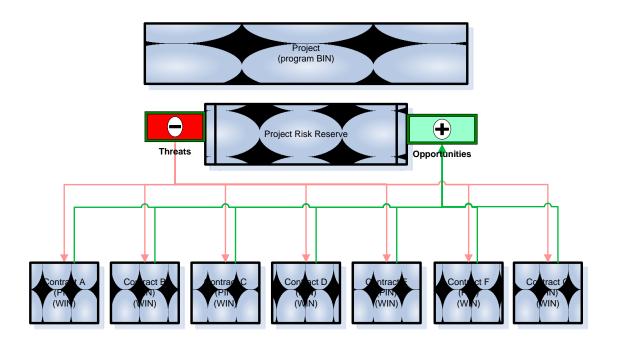

- New key risk(s) are identified.
- Implementing risk response or risk mitigation strategies.
- The aging of a risk trigger.

Following is a description of the processes that will be followed for each event listed above. The processes are intended to provide mechanisms for formal approval of the movement of funds between unallocated and allocated contingencies, of funds between allocated contingencies and base cost, and for acceptance of the schedule impacts of that event. They also provide documentation to support any decision to move such funds. In general, adjustments to the base cost and schedule for risks that materialize or for risk response strategies will be made when such adjustments are approved. Adjustments to the allocated and unallocated contingencies will be made following established change management procedures as outlined in Section 3 of the Project Management Plan for the CRC program.

Summary of Risk contingency Management

1. Establish separate "Reserve WINs" of specifically allocated reserve for each contract and manage through the CRC Change Control process.

- 2. Establish a separate "Reserve WIN" for the overall proposed CRC project consisting of General Reserve.
- 3. Review to determine if applicable to Risk Register items in the "Specifically Allocated" list.
- 4. Reserve will be moved from the Reserve WIN to the given contract based on review and approval notices by the CRC Change Control.
- 5. Approved Notices not concerning Specifically Allocated Risk Register items will be funded from CRC General Reserve (unallocated contingency).
- 6. The CRC Cost Engineering section will track consumption of reserve.

7. Secondary Mitigation

CRC Secondary Mitigation consists of pre-planned strategies to mitigate potential scope or process changes that are triggered by risk events occurring. Examples of potential issues related to CRC include: Environmental factors including artifact discovery, geotechnical concerns, and bidding environment for construction contracts.

7.1 Recovery Plans

A recovery plan (secondary mitigation) if contingency levels drop below the FTA minimum will be developed. The CRC project management will develop and approve a mitigation list of elements that may be deleted or deferred if necessary. Once this is accomplished it will be added to the next update of this RCMP.

DETAIL TO BE ADDED

7-2 Risk and Contingency Management Plan Draft Report

This page left blank intentionally.

8. Risk Management and Risk Mitigation

8.1 Assessing Project Cost and Schedule Risk

Ongoing and pro-active risk management involves adding new significant risks as they are identified and insuring they will be assigned a risk owner.

Opportunity risks: the risk owner, working with the project team, will develop a proposed strategy to maximize the likelihood and/or beneficial impacts of the opportunity. If the strategy is approved by the Executive Management Team through the established change management process, the Risk Owner will make the necessary revisions and re-submit for entry into the project plan through the Business Service Manager, the base cost will be adjusted to include the cost of the response strategy, the schedule will be adjusted if necessary, and the risk will be added to the risk database.

Threat risks: the risk owner, working with the project team, will develop a proposed strategy to minimize the likelihood and/or impacts of the threat. If the strategy is approved by the Executive Management Team through the established change management process, the Risk Owner will make the necessary revisions and re-submit for entry into the project plan through the Business Service Manager, the base cost will be adjusted to include the cost of the response strategy, the schedule will be adjusted if necessary, and the risk will be added to the risk database. Residual risk, if significant, will be added to the risk database.

The contingency reserves for budget and schedule will be adjusted after results are available for the first CEVP performed after the new risk or risks have been added to the database.

8.2 Developing risk handling options Strategies Adopted

As stated in the paragraphs above, the cost of approved response or mitigation strategies will be added to the base cost, the schedule will be adjusted if necessary, and the risk database will be revised to reflect the residual risk. Contingency reserves for budget and schedule will be adjusted *after* results are available from the next CEVP workshop.

8.3 Developing Secondary Mitigation Plans

The process of recognizing and incorporating the impact of a risk event occurring is initiated when the Risk Owner submits a notice identifying such to the project management. When a risk materializes, the base cost and/or schedule is revised following discussion and review by the project manager, Risk Manager, and appropriate specialty review by discipline for the risk. The project team will follow established change management processes and look for strategies to offset the impact of the change, such as reducing scope, and if necessary and appropriate, budget and schedule adjustments will be made.

8.4 Monitoring Risks

As we continue through project development the project risk profile will change. Typically as we successfully respond to risks and our project knowledge increases our risk exposure will diminish. In effect we can retire risk reserve as risk events are successfully avoided or mitigated or we have passed the time during which the risk is active and it becomes retired.

After we have implemented response actions, we must track and record their effectiveness and any changes to the project risk profile. Did the response actions have a positive or negative effect on achieving project objectives? If so explain how and why in the risk management plan.

8.5 Documenting and Reporting

The risk drawdown curves will be reviewed and updated at appropriate intervals. Tracking the use of the risk reserves, and reporting on contingency management on a program-wide basis will be performed regularly. Project Risk Leads will be responsible for tracking the use of allocated contingency reserves and identifying risk mitigation strategies at a project level and ensuring program procedures are followed when requesting the transfer of funds from the risk reserve to base cost estimate.

The documentation required for approval to retire risks or to transfer funds from the contingency fund to the base cost estimate will be logged with Document Controls.

Progress and updates will be provided in the Monthly and Quarterly Reports and/or on an asrequired basis.

8.5.1 Retiring Risks

The unmitigated risk or the residual risk does not materialize and the trigger for that risk has passed, the risk is simply retired and noted as such in the database. The effect of this will not be incorporated into the contingency reserves until the next CEVP.

Funds can only be moved and schedule impacts accepted upon approval from the Risk Manager up to pre-determined thresholds or by a Contingency Management Committee (CMC) if the thresholds are exceeded. The committee will comprise a representative each from the grantee (WSDOT) and each sub recipient (ODOT, TriMet and C-TRAN).

Cost Estimate Validation Process – An intense workshop where transportation projects are examined by a team of top engineers and risk managers from local and national private firms and public agencies who review project details with WSDOT engineers. Many of the participants have had extensive first-hand experience with large programming and delivery. The CEVP workshop team uses systematic project review and risk assessment methods to evaluate the quality of the information at

	hand, and to identify and describe cost and schedule risks. Importantly, the process examines how risks can be lowered and vulnerabilities cut, managed or reduced.
Federal Transit Authority (FTA) Risk Assessment	A risk assessment process coordinated by the FTA to evaluate project scope, cost estimate, schedule and risks of the project.
Reserves	Funds established for risk and uncertainty, and unknown contingencies. During construction, actual accounts will be set up and funds reserved.
Risk*	The effect of uncertainty on objectives. Source: ISO 31000, ISO/IEC Guide 73:2009 – Vocabulary for Risk Management
Specific Risk Categories**	Technical Capacity risks are risks that affect project delivery as a result of available resources, and strategies to address these risks. Can include workforce and management limitations as well as staff turnover. <i>Technical Capacity Risks and Mitigations</i> .
	In addition to Technical Capacity risks four categories of risk which may present a threat or an opportunity, have been adopted for the CRC project:
	 <i>Requirements Risk</i> relates to the establishment and variability of fundamental goals and conditions of a project to which the design must respond, as well as the activities of the Grantee to actively identify these goals and conditions. <i>Design Risk</i> is associated with the performance and variability of design-related activities occurring after Alternatives Analysis. <i>Market Risk</i> is related to the procurement of construction services, materials, and equipment, and the variability associated therewith.
	• <i>Construction risk</i> includes both risks that are due to the inevitable variability of the project's environment—including such items as unusual weather, unexpected subsurface conditions, and unexpected construction contractor failure—as well as performance risk that is manageable by the Grantee and its consultants and contractors <i>Source: Federal Transit Administration Oversight Procedures 40 Risk and Contingency Review</i>
	*Risk can be positive or negative, an event that presents a potential positive impact to project objectives is an opportunity; an event that poses a negative impact to project objectives is a threat.
	**In addition to these general categories detailed identifiers and risk

In addition to these general categories detailed identifiers and risk breakdown structures as well as standard cost categories are used and described in much more detail later in this document. **APPENDICES

RIS	PRIMARY	STATUS	SCC	CATEGORY	DDC		DESCRIPTION	TRICCER	RISK	OWNER		PRE-RESPONS	1		RESPONSE
K ID	PROJECT	STATUS	SCC	CATEGORY	RBS	RISK EVENT	DESCRIPTION	TRIGGER	PRIMARY	SECONDAR Y	LIKELIHOO D	COST	SCHEDUL E	STRATEG Y	ACTION
001	Hayden Island- Mainland Connecto r	Active	60.01	Design	ROW 10	Opportunity to not acquire Ross Island Sand and Gravel	Full acquisition is in the base cost estimate. Opportunity to get deviation through IAMP to provide access without this property so might not have to acquire. Before we enter the final design phase and begin the right of way phase, it should be fairly certain if the acquisition will be a total take. This is a parcel with a greater than \$5 million dollar impact.	ΙΑΜΡ	Joe Gray	Mike Palazzo	30%	-\$12.0 million	0.0 mths	Mitigate	Opportunity to be resolved with IAMP. Before we enter the final design phase and begin the right of way phase, it should be fairly certain if the acquisition will be a total take.
002	Columbia River Bridges	Active	90	Requirement s	PSP 20	Delay to ODOT/WSDOT agreement for tolling	This pertains to O&M (tolling). Only the funding and construction agreements are in place. There is a chance that there will be challenges getting agreement on finance plan, particular tolling finance and governance. Could affect FTA FFGA application. Risk is considered to be minor (i.e. very low probability).	FFGA Application	Mike Williams	Steve Siegel	0%	\$0.0 million	0.0 mths	Avoid	Develop term sheets through early discussions between ODOT & WSDOT. Capitalize on existing bi-state agreements between WSDOT and ODOT.
003	Columbia River Bridges	Active	80.02	Design	RR 10	Railroad agreement term sheets take longer than assumed	This could delay construction. Delay in getting railroad term sheets delays entry into FTA final design - need term sheet by the end of 2011. Railroad may require their own flaggers during construction and will need to approve encroachment onto their right of way for construction. Impacts SR 14 and transit north approach.	Construction	Laura Peterson	Devin Reck	35%	\$0.0 million	1.5 mths	Avoid	Early discussions happening with BNSF to reduce the risk of delay. Potential completion of agreement with BNSF before application to enter Final Design.
004	Hayden Island- Mainland Connecto r	Active	90	Requirement s	PSP 20	Delay to agreements with the City of Portland	Agreements include: TriMet and City over arterial bridge ownership and operation; ROW agreements; O&M agreements; arterial bridge; and ODOT O&M agreements. Aesthetics agreements are excluded.	FFGA Application	Paul Heydenrych	Wesley King	20%	\$0.0 million	0.5 mths	Mitigate	To be tied into operations and maintenance plans being developed with the COP. Deliverable COP/TriMet Agreement O&M.
005	Program Wide	Active	40.05		PSP 30	Delays getting agreements on aesthetics with partner agencies	Partner agencies will want to be involved with hiring architects and getting feedback on aesthetic elements of project. This could affect completing development of the RFP. Cost issues with aesthetics are captured elsewhere.	DAP	Casey Liles	Devin Reck	20%	\$0.0 million	0.7 mths	Mitigate	Early discussion with partner agencies and involvement in RFQ RFP process for bridge architect.
006	Columbia River Bridges	Active	40.05	Requirement s	MGT 900	Cost sharing agreement for CRB is necessary to avoid shifts in cost allocation	Agreement between, CRC, FHWA, FTA need to allocate costs of bridge between the various agencies. Considered to be a minor risk.	FFGA Application	Casey Liles	Devin Reck	0%	\$0.0 million	0.0 mths	Mitigate	Develop term sheets. Recognize FTA guidelines on financial match and associated milestones. Deliverable: IGA between Transit and Highway addressing the approach.

									RISK C	OWNER	ESTIMATED	PRE-RESPONS	SE IMPACT		RESPONSE

007	TriMet Contracts	Active	30.02	Requirement s	MGT 900	Milwaukee project does not proceed.	If Milwaukee project is not constructed, CRC would possibly need to take on more costs associated with Ruby Junction.	No PMLR FFGA issued	Wesley King	Vicky Smith	10%	\$5.0 million	0.0 mths	Accept	Milwaukie project is moving forward however there is an adjustment in projected cost sharing. Griffiths to produce a financial plan for Ruby Junction Maintenance Facility Split with TriMet's Portland to Milwaukee.
008	Columbia River Bridges	Active	40.05	Construction	CTR 20	Consensus issues on design package for Main River Crossing DB RFP	Differences between ODOT and WSDOT specifications will be difficult to resolve. FTA also involved as transit will be on S/B bridge, and the agency may view unresolved differences as a technical capacity issue; one that could delay approvals.		Casey Liles	Devin Reck	25%	\$0.0 million	1.0 mths	Accept	Develop Design Acceptance Package (Oregon). Continue coordination with between CRC, WSDOT and ODOT.
009	Program Wide	Active	90	Construction	CTR 10	Significant change in construction sequencing/phasing	Captured largely through other opportunities in this register and the base duration uncertainty for the DB contracts. Considered to be a minor risk.	Package Identification	Mike Niemi	Lynn Rust	0%	\$0.0 million	0.0 mths	Accept	Based on the need for packaging and availability of funding this risk will occur.
010	Program Wide	Active	90	Construction	CNS 900	Significant construction claims	Base costs include some allowance for change orders and claims (2% of construction for DB, 4% overall for DBB). Minor additional here. Excludes differing site conditions for foundations. Considered to be a minor risk.	Proposal Review	Mike Niemi	Lynn Rust	0%	\$0.0 million	0.0 mths	Mitigate	Propose timely response to claims and identify and ripple effect to other projects
011	Program Wide	Active	40.05	Construction	CNS 900	Differing site conditions for foundations	This is separate from anticipated construction claims allowance. Perhaps 2% of base deep foundation costs for the project, which is still relatively minor.	When Realized	Mike Niemi	Lynn Rust	0%	\$0.0 million	0.0 mths	Mitigate	Development of Geotechnical report and program, some transference to contractor.
012	Columbia River Bridges	Active	40.05	Construction	CNS 90	River traffic accidents could lead to schedule delay and associated costs	Could include ships colliding with construction equipment or temporary structures, coffer dams, etc. Most likely minor possibility of impact to the project. Considered to be a minor risk.	Collision	Mike Niemi	Lynn Rust	0%	\$0.0 million	0.0 mths	Mitigate	Supplement tug and river pilots; provide construction schedule and staging plan to barge companies. Deliverable: Conduct of Construction Plan for River Crossing.
013	Highway OR	Active	40.05	Construction	CNS 900	Rapid construction of jump span.	For example, build offline and roll in (SPMT). Minor direct cost impact. Could be a reduction in schedule for the jump span, but perhaps not for the overall duration of constructing the interchanges. Risk is considered to be minor (i.e. very low probability). Considered to be a minor risk.		Mike Niemi	Lynn Rust	0%	\$0.0 million	0.0 mths	Mitigate	
014	Program Wide	Active	90	Requirement s	DES 900	Significant change in project limits	Very unlikely to occur. The FEIS includes the Full Build as well as the LPA Phase I. Considered to be a minor risk.		Casey Liles	Devin Reck	0%	\$0.0 million	0.0 mths	Mitigate	As design is refined continued coordination with the various disciplines (etc.) will continue to ensure that changes are reflected and captured appropriately.

									RISK C	OWNER	ESTIMATED	PRE-RESPONS	E IMPACT		RESPONSE
RIS K ID	PRIMARY PROJECT	STATUS	SCC	CATEGORY	RBS	RISK EVENT	DESCRIPTION	TRIGGER	PRIMARY	SECONDAR Y	LIKELIHOO D	соѕт	SCHEDUL E	STRATEG Y	ACTION
015	Transit WA	Active	90	Requirement s	DES 900	Significant change in transit concept/design	Discussion of options for reducing costs of transit across the entire alignment. Unlikely for any major change in concept. Risk is considered to be minor (i.e. very low probability). Considered to be a minor risk.		Wesley King	Vicky Smith	0%	\$0.0 million	0.0 mths	Mitigate	Discussion of options for reducing costs of transit across the entire alignment. A VE workshop is planned for mid- January 2012.
016	Columbia River Bridges	Active	40.05	Construction	ENV 20	New Endangered Species Act listing during construction	Species currently present in area is listed under ESA before end of construction, requires reinitiating of ESA consultation, new conservation measures.	New ESA listing	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Continue tracking ESA listing developments through agency coordination and contact. Project has already incorporated impact minimization measures that can be used if lamprey or streaked horned larks are listed.
017	Columbia River Bridges	Active	40.05	Requirement s	ENV 20	New listed species shows up in the project area	Currently listed species arrives in project area before end of construction, requires reinitiating of ESA consultation, new conservation measures	New species observed	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Track listed species sightings on a regular basis. Very low risk, unless orca start following sea lions to Bonneville. Continuing the tracking of ESA listing developments through agency coordination and contact. Any listings likely will be addressed by project before the ESA listing is official.
018	Program Wide	Active	90	Construction	ENV 20	Terms and conditions of the BO and other approvals cannot be met during construction	Examples: pile driving operations cause more take than Biological Opinion called out, despite best efforts of contractor. Recent completion of the Test Pile Program has validated project team's conservative estimates for take.	Construction	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Re-initiate consultation if the terms and conditions are impossible to meet. Monitor the contractor during construction. Deliverable: Biological Opinion.
019	Program Wide	Active	40.03	Construction	ENV 50	Hazardous materials liability associated with property acquisition	Primary concern is Hayden Island and Marine Drive, unknown hazmat. The base cost estimate has some allocation for this.	Environmenta I Assessments	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Phase I and Phase II hazardous materials analysis.
020	Program Wide	Active	90	Requirement s	ENV 10	Controversy on environmental process leads to Post-ROD NEPA challenge	Likelihood of a challenge is high, and it may result in delay. May delay ROW acquisition through injunction. The likelihood of a delay resulting from the challenge depends on the outcome from this set of potential, mutually-exclusive outcomes.	ROD	WSDOT Attorney General	Heather Wills	20%	\$0.0 million	1.2 mths	Accept	The project has no control over whether the ROD is challenged. To mitigate the impact of expected challenges, ensure that due process is followed and that the process is fully documented. Ongoing coordination with NPS and other stakeholders prior to finalizing the 4 (f) documents. Nearly 100% guarantee that there will be a challenge by an interested party.
021	Program Wide	Active	90	Requirement s	ENV 70	Environmental regulations change	Water quality regulations, definition of jurisdictional resources (e.g., ditches). Schedule impact larger if change occurs later.	Construction	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Track draft rules and policy changes through construction. Continued coordination with regulatory agencies.

									RISK C	OWNER	ESTIMATED	PRE-RESPONS	SE IMPACT		RESPONSE

022	Program Wide	Active	90	Requirement s	PSP 20	Interagency coordination/agreements Post- ROD	Marine Mammal Protection Act, Corps 404, Section 9 RHA (USCG), DEQ 401, Ecology 401, WA WPCA, OR Removal-Fill, WDFW HPA, ODFW Fish Passage, ODFW Habitat Mitigation, COP, COV, Other EPA.		Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Track terms and conditions of existing authorizations and like terms from authorizations still needed. Continued coordination with regulatory agencies.
023	Program Wide	Active	90	Requirement s	PSP 10	Tribal consultation	Ensure that there are not fatal flaws for natural resources and cultural resources with the tribes.	ROD	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Recent interaction with CRITFC and tribes indicate issues with project; despite on-going coordination and communication. Likely a demand for additional mitigation.
024	Program Wide	Active	40.04	Construction	ENV 80	Inadvertent discovery of human remains	Risks associated with discovering human archaeological remains during excavation, demolition, construction	Construction	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Even with an inadvertent discovery plan, there is still a risk for delay. Add cost impact of \$1 to \$5M.
025	Program Wide	Active	90	Construction	CNS 20	Contractor not following the terms and conditions of permits	Example: IWWW needs to be extended to complete work operations. Permits include all listed in above risk.	RFP Release	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Place permits into bid packages, highlight need for compliance, and penalties for lapses. Place permits into bid packages, highlight need for compliance, and penalties for lapses.
026	Program Wide	Active	40.04	Requirement s	ENV 10	Negative community impacts expected (civil rights title VI lawsuit or EJ issues)	Potential lawsuit on EJ issues; various pressures from communities	ROD	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Revise risk to a cost risk, remove 2 month delay.
027	Program Wide	Active	40.04	Construction	ENV 80	Unexpected cultural resources may be encountered	Associated with demolition and construction. Some areas cannot be easily investigated until construction begins. This risk does not include inadvertent discovery of human remains.	Construction	Heather Wills		30%	\$0.5 million	0.0 mths	Mitigate	Will likely find a lot of common items on Vancouver side, which will likely not be significant and will not cause a delay. There is a chance of finding something that might cause a delay. \$0.5 million cost impact at most for cataloging.
028	Program Wide	Active	40.04	Construction	ENV 80	Environmental impacts of demolition/excavation/dewaterin g work (underground)	Applies to on land demolition not in water. Risks associated with demolition work: contamination of soil conditions, ground water, disposal site, sediments. Level of contamination unknown.	Drilled shaft test program	Heather Wills		30%	\$0.5 million	0.0 mths	Mitigate	Identify construction techniques for on land demolition as early as possible to complete any environmental work necessary. Should EPA approve CRC Focused Environmental Assessment Work Plan, risk could be reduced.

	PRIMARY								RISK (OWNER	ESTIMATED	PRE-RESPONS	E IMPACT		RESPONSE
RIS K ID	PROJECT	STATUS	SCC	CATEGORY	RBS	RISK EVENT	DESCRIPTION	TRIGGER	PRIMARY	SECONDAR Y	LIKELIHOO D	COST	SCHEDUL E	STRATEG Y	ACTION
029	Program Wide	Active	60.02	Design	ROW 50	Unknown or unresolved relocation for right of way acquisition	Property owner can delay acquisition in WA, resulting in additional costs and delays. Parcels are currently not yet into the acquisition process; haven't talked to property owners. This may be driven by design changes; likelihood of significant design changes is low. As acquisition process proceeds later acquisitions that may be delayed can have a greater impact.		Joe Gray	Mike Palazzo	0%	\$0.0 million	0.0 mths	Mitigate	Lock in alignment ASAP. States can take possession and resolve \$\$ through appeal process.
030	Columbia River Bridges	Active	40.05	Requirement s	ENV 80	Marine mammal monitoring	Monitoring requirements could further restrict construction beyond current assumptions.	LOA of MMPA	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Very low risk now, less than 10% that will need monitoring beyond what is currently planned. Project did marine mammal monitoring during test pile project. NMFS was OK with monitoring effort.
031	Columbia River Bridges	Active	40.05	Requirement S	PSP 20	Delay in obtaining USCG permit/agreement	Can apply for permit as soon as have ROD. Project has been communicating with USCG, and primary interest is maintaining navigable channel. Considered to be a minor risk.	RFP	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Continue coordination with USGS. Pre-application meetings with regulatory agencies at the federal, state and local levels will be scheduled in fall 2011.
032	Program Wide	Active	90	Requirement s	ENV 30	Challenge to major permit (e.g. a Section 404 Permit)	There is some opposition to the project with threats to sue, but not under the 404 permit specifically. Given the time in the base schedule between ROD and start of construction, there is unlikely to be a significant on schedule. Risk is considered to be minor (i.e. low probability and unlikely impact on schedule).	RFP	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Continue coordination with agencies. Pre-application meetings with all regulatory agencies will be scheduled this fall; however risk remains of a 3rd party opposing the project can interject during the permit process
033	Program Wide	Active	40.04	Requirement s	ENV 60	Changes to proposed wetland, floodplain, or other mitigation requirements	Current mitigation is at a ratio of 10:1, versus lower requirements (e.g. 3:1). Minimal impact to river level from piers expected. Risk is considered to be minor (i.e. very low probability). Potential impacts to jurisdictional wetlands on property project have not been allowed to access.	Proposal Review	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Continue coordination with agencies. InterCEP concurrence point in May, 2010 was InterCEP partner's concurrence with proposed CRC compensatory mitigation.
034	Program Wide	Active	90	Requirement S	PSP 900	Delays in obtaining land use permits	It is anticipated that there is sufficient time for the permitting process in the base schedule (18 months). Risk is considered minor (i.e. very low probability).	RFP Release	Heather Wills		0%	\$0.0 million	0.0 mths	Mitigate	Continue coordination with agencies. Pre-application meetings will be scheduled this fall with City of Portland and City of Vancouver.

085	OR Wide	Active	40.05	Design	STG 20	Drilled shafts need to be deeper in the vicinity of Marine Drive and Hayden Island	Base costs assume depths of 150' and 130' at Marine Drive and Hayden Island interchanges, respectively. Opportunity to use piles on Hayden Island and Marine Drive. Upper end is having to use 210' deep shafts on the Oregon bridges; Most likely is to use 150' deep piles; Lower end assumes 125' deep piles.	Geotechnical Report	Frank Green	Laura Peterson	15%	\$10.0 million	0.0 mths	Transfer	Due to the change to design- build at the Hayden Island and Marine Drive interchanges, the design builder will optimize the design within the bounds of the RFP requirements. Will include in the results of the drilled shaft and driven pile test program in the RFP to provide the design- builder an additional basis for efficient design of foundations.
086	Highway WA	Active	40.05	Design	STG 10	Wall type north of Fourth Plain (west side) could change	Base estimate assumes soldier pile, may need to change to secant pile.	Geotechnical Report	Frank Green	Laura Peterson	0%	\$0.0 million	0.0 mths	Mitigate	Base estimate assumes soldier pile with tie back, may need to change to secant pile. Fairly low risk, already assuming secant piles in pinch point. Should not have a schedule impact.
087	Program Wide	Active	40.05	Construction	CNS 900	Conflicts with existing bridge foundations will require field modifications	Impacts of needing to move a pier during construction; redesign during construction. Planning to put foundations in existing median, near existing foundations. If as-builts are wrong, would need to move new foundation location.	Construction	Frank Green	Laura Peterson	0%	\$0.0 million	0.0 mths	Mitigate	Survey the above-ground features and search construction records to minimize conflicts. Lay out bridges to avoid existing foundations where practical. Designs incorporating best understanding of existing foundation locations.

RIS K ID	PRIMARY PROJECT	STATUS	SCC	CATEGORY	RBS	RISK EVENT	DESCRIPTION	TRIGGER	PRIMARY	SECONDAR Y	LIKELIHOO D	COST	SCHEDUL E	STRATEG Y	ACTION
088	Hayden Island- Mainland Connecto r	Active	40.05	Design	STG 10	Arterial bridge over the North Portland Harbor changes type	Base assumption is steel plate girder bridge, chance that it could change to weathering steel (small premium) or something else iconic (limited on the types). Potential (mutually- exclusive) outcomes: a) 30% chance of base; b) 10% chance of \$45M extra; or c) 60% chance of \$10M extra. No time impact (not critical to the overall activity).	COP Design Review	Frank Green	Laura Peterson	60%	\$10.0 million	0.0 mths	Mitigate	Work with affected agencies to develop a common understanding of structure type implications. Deliverable: TS&L of Bridge Structure.
089	Columbia River Bridges	Active	40.04	Design	ENV 40	Seismic retrofit is required for Post Hospital	On one corner of the Post Hospital, coming 6' away with secant pile wall. Foundation of the hospital is cobbles. Construction activity near hospital could damage the foundation. Hospital is a historical structure.	COV/WSDOT IGA	Frank Green	Laura Peterson	0%	\$0.0 million	0.0 mths	Avoid	Could reduce the amount of vibration by specifying means and methods to the contractor. High likelihood of doing something, with wide range of potential cost impacts. Low end to excavate around foundation and reinforce; cost impact of \$200k with 75% probability. High end for drilled micro piles; \$5 million with 10% probability.
090	Columbia River Bridges	Active	40.05	Design	CTR 900	Design complexities and increased bid costs for the composite truss structure	Some accounted for in the base, this is above what is accounted for in the base. Considered to be a minor risk.	Receive Proposals	Frank Green	Laura Peterson	0%	\$0.0 million	0.0 mths	Accept	Design builder will address detailed design of deck truss.
091	Columbia River Bridges	Active	40.05	Design	DES 30	Additional aesthetics required for the CRB	This accounts for changes in structural elements to accommodate aesthetics. Considered to be same as Risk ID 079.	Architectural Guidelines	Frank Green	Laura Peterson	0%	\$0.0 million	0.0 mths	Mitigate	Work with architectural team to understand cost/structural implications and architectural opportunities.
092	Columbia River Bridges	Active	40.05	Design	STG 20	Test shaft/pile program (on land) to reduce foundation costs	Test program would cost \$5 million, may reduce bid costs.		Frank Green	Laura Peterson	30%	-\$30.0 million	0.0 mths	Accept	Structure program to capture data for a variety of foundation scenarios. Deliverable: Drilled shaft test program documents.
093	Columbia River Bridges	Active	40.05	Design	STG 10	Hayden Island structures shortened by creating new fills	Potential to shorten structures by switching to fills in some areas. Possibly several hundred feet of structures could be removed. Potential \$10M savings on structures side. However, this option only likely to work if lightweight fill were used. More ground improvement likely needed for this option. Height of fills required makes this option iffy. Savings likely minor as a result of all these issues.	Receive Proposals	Frank Green	Laura Peterson	0%	\$0.0 million	0.0 mths	Accept	During next phase of design development, after geotechnical recommendations are received, CRC can determine whether or not savings can be realized with walls on HI vs. structures. The most cost-effective approach can be shown in the RFP.

143	OR Wide	Active	80.07	Design	ROW 50	Rights of Entry are delayed	There is reluctance to engage the property owners during the discussions with the Oregon legislature. Establishing the final r/w boundary is dependent on having an accurate terrain model which is dependent on gaining right of entry to private property.	Delay in Engaging Owners	Joe Gray		60%	\$0.0 million	3.6 mths	Mitigate	The project team is having discussions with the legislature now.	
144	Transit WA	Active	20.06	Design	DES 60	Central Park and Ride Exterior Foundation Wall	Preliminary foundation design assumes no earth loads on basement walls for the Central Park and Ride. This reduces basement wall thickness and amount of internal shear walls. A perimeter MSE wall is assumed to retain earth loads.		Joe Eskew		75%	\$2.5 million	4.5 mths	Avoid	Final design could provide internal load bearing/shear walls with a reconfiguration of basement parking.

145	Transit WA	Active	20.06	Design	DES 60	Park and Ride Deep Foundations	Preliminary geotechnical information suggests deep foundations may be necessary to support all three park and ride structures while limiting settlement. Preliminary foundation design assumed continuous mat foundations and soil reinforcement to limit settlement.		Joe Eskew		50%	\$115.0 million	6.0 mths	Avoid
