APPENDIX I

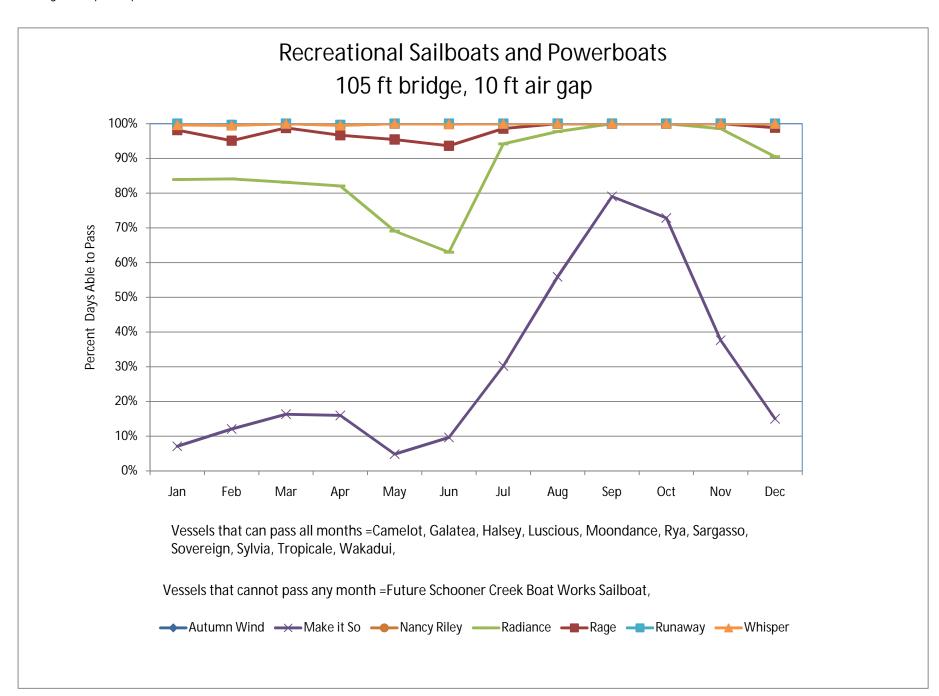

Percent of Days per Month that Impacted Vessels Could Pass Under Each Bridge Height, Presented by Bridge Height

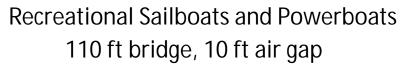

Appendix I provides tables and showing the percent of days per month that vessels could pass under each of the mid-level bridge heights (95 to 125 feet) evaluated. The analysis assumes a 10-foot air gap between the highest point of the vessel and lowest part of the bridge. There are separate tables for each bridge height for each vessel class.

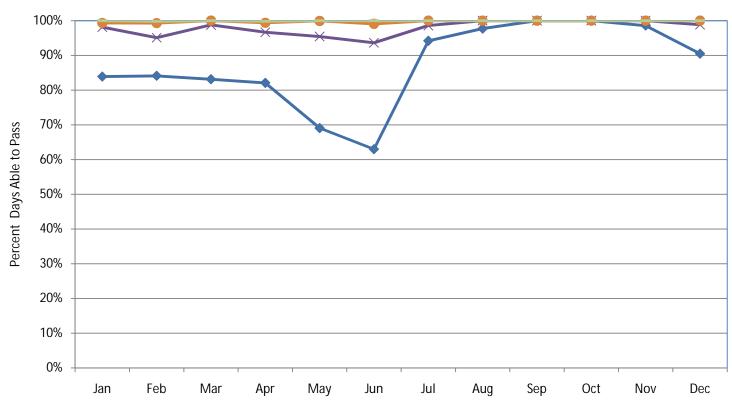

The analysis for this appendix is based on daily river level data collected from October 1, 1972 through July 3, 2012. These charts and tables include any vessel that would have been prevented from passing one or more days during that 40-year period. As such, more vessels are included here than are discussed in the impact analysis of the report. The basic impact analysis in the report defined an impact to occur when a vessel, with a ten foot air gap, could not pass under the bridge when the river level is at 16 feet above CRD or higher. River levels have been below 16 feet for more than 98 percent of the days over the past 40 years.

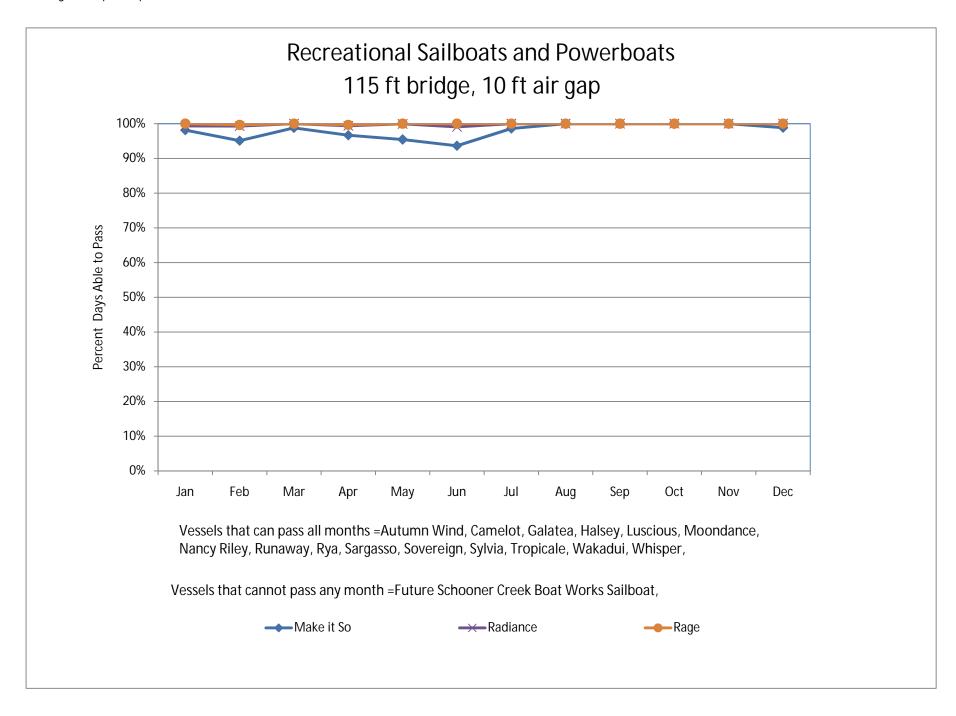

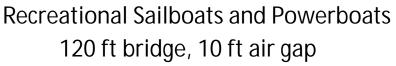

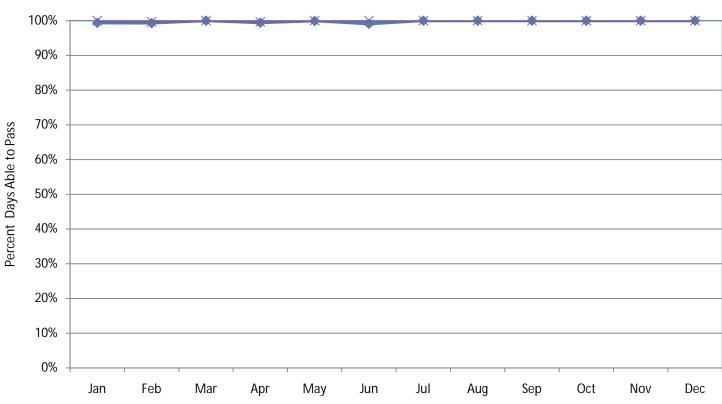

Vessels that can pass all months = Autumn Wind, Camelot, Galatea, Halsey, Luscious, Moondance, Nancy Riley, Runaway, Rya, Sargasso, Sovereign, Sylvia, Tropicale, Wakadui,
