	IDR Sheet	2	of	5	Sheets
Contract	Day				Date
C8078		Wednes	day		February 16, 2011

DIARY - Including but not limited to: a report of the day's operations, time log (if applicable), orders given and received, discussions with contractor, and any applicable statements for the monthly estimate.

7:00AM On site at the Vancouver Boat Landing.

7:30AM American Construction is mobing from site A to site B using a Tidewater Barge tugboat to move them. Once the barge is in position it spuds in and is anchored into position.

8:30AM Have 48" pile B-2 in the water. The pile is in at a depth of 40'. David Evans and Associates, INC. begins to set their hydroacoustic monitoring equipment at 200, 400 and 800 meters upstream and 800 meters downstream.

8:45AM On board the barge. Mike Zenthoefer(Parametrix) is on site to coordinate between (DEA) acoustic monitoring and the staff that is monitoring for sea lions. Bert Miner(Robert Miner Dynamic Testing) is on site to perform the dynamic testing on the pile today.

9:00AM The pile is surveyed into position from shore by Vernon Uy(American Construction/Supervisor). The pile is checked for plumb and held into position by the crew on the 16' workskiff. King Kong model 400 vibrator is set onto the pile. Mike says that we cannot begin to vibrate in the pile until 9:25AM since the monitoring didn't start until 8:45AM. I let Dave Gilchrist(American Construction/Pile Buck Foreman) know that we cannot begin until 9:25AM or until DEA has all of their equipment set up.

9:50AM DEA is finished setting up their hydrophone up at 10 meters. I check with Mike and it is clear to begin vibing in the pile. I let Dave know that they can begin. Start vibing in pile B-2 in planned location.

9:55AM Finish vibrating in the pile. The pile is at 67'. Vernon lets me know that there is 20' of driving.

10:05AM Mark Degenhart(CRC) lets me know that the first half of the pile the air to the confined bubble curtain is to be off and the second half both the top and the bottom ring are to be turned on with just enough air to not have the fountain effect.

10:30AM Vernon tells me that the confined curtain is close to the dynamic testing sensors and that the last 3-4' will have to be driven without the curtain so the sensors do not get wet. I call Mark and let him know that the last 3-4' will be driven without the bubble curtain. Mark says that is fine.

Todd Nelson

Contract	Day				Date
C8078	Wednesday			February 16, 2011	

DIARY - Including but not limited to: a report of the day's operations, time log (if applicable), orders given and received, discussions with contractor, and any applicable statements for the monthly estimate.

11:00AM Talk with Ken Johnson(American Construction/Deck Engineer) and let him know what we are going to do today with the air pressure. I let him know that the air is to be off for the first half of the pile driving and that he is to have both the top and the bottom rings on just enough to not create a fountain. I tell Ken to turn the air on and off when the 85' and 90' marks reach the top of the HDPE ring. I check with Mike and it is all clear to begin pile driving. Start pile driving using D80-42.

11:10AM Stop pile driving at 84.5' so that the dynamic testing sensors can be removed. Ken tells me that the air was set at 100CFM.

11:40AM Remove the confined bubble curtain.

11:55AM Sensors are reattached. I check with Mike and it is all clear to begin pile driving. Continue pile driving using D80-42.

12:00PM Finish driving pile B-2 at 87.5'. I ask Dave what his plans are. Dave says that they are going to take lunch and then start on pile B-1.

1:00PM Vernon calls and tells me that they are done for the day. Vernon says that they still need to move the crane back and they need to change the heads on the King Kong. Lights are put on pile B-2.

1:30PM Off the barge.
