Comment:

Dear Sirs:

The report fails to describe the effects of the new 520 bridge on water flow on the creek that runs through Fairweather park. During rain storms, the flow can be very high, leading to erosion. The large proposed cap may increase water run off and the effect on the creek should be noted. In addition, lack of water flow may effect the ground water in the park leading to loss of trees.

Please evaluate the effect of the new bridge on the creek.

George Montgomery
